This document is typeset using $PDFT_EX$. The body font is Lucida Bright at 10 points. The layout is based on a 24 cm square paper size, scaled down .875 to fit nicely on an A4.

Preface

This manual is about CONT_EXT, a system for typesetting documents. Central element in this name is the word TFX because the typographical programming language TFX is the base for CONT_EXT.

People who are used to T_FX will probably identify this manual as a T_FX document. They recognise the use of $\$. One may also notice that the way pararaphs are broken into lines is often better than in the avarage typesetting system.

In this manual we will not discuss T_FX in depth because highly recommended books on T_FX already exist. We would like to mention:

- 1. the unsurpassed *The T_FXBook* by Donald E. Knuth, the source of all knowledge and T_FXnical inspiration,
- 2. the convenient *T_FX by Topic* by Victor Eijkhout, the reference manual for T_FX programmers, and
- 3. the recommended *The Beginners Book of T_{\rm E}X* by Silvio Levy and Raymond Seroul, the book that turns every beginner into an expert

For newcomers we advise (3), for the curious (1), and for the impatient (2). CONTFXT users will not need this literature, unless one wants to program in T_FX, uses special characters, or has to typeset math. Again, we would advise (3).

You may ask yourself if T_FX is not one of the many typesetting systems to produce documents. That is not so. While many systems in eighties and nineties pretended to deliver perfect typographical output, T_FX still does a pretty good job compared to others.

T_FX is not easy to work with, but when one gets accustemed to it, we hope you will appreciate its features,

Hans Hagen, 1996-1999

Introduction

1.1

T_FX

 T_EX was developed at the Stanford University during the seventies. The designer, developer and spiritual father of T_EX is Donald E. Knuth. Knuth developed T_EX to typeset his own publications and to give an example of a systematically developed and annotated program.

The T_EX project was supported by the American Mathematical Society and resulted in the programming language and program T_EX , the programming language and program METAFONT, the Computer Modern typefaces and a number of tools and publications.

T_EX is used worldwide, supports many languages, runs on almost every platform and is stable since 1982, which is rather unique in today's information technology.

 T_EX is a batch-oriented typesetting system. This means that the complete text is processed from beginning to end during which typesetting commands are interpreted. Because you tell your typesetting intentions to T_EX , the system can also be qualified as an intentional typesetting system.

In most documents one can stick to commands that define the structure and leave the typographic details to CoNT_EXT. One can concentrate on the content, instead of on makeup; the author can concentrate on his reader and his intentions with the text. In this respect one can classify CoNT_EXT as an intentional system. We prefer such a system over a page-oriented system, especially in situations where you have to process bulky documents of with regularly changing content. Furthermore an intentional typesetting system is rather flexible and makes it possible to change layout properties depending on its application. It can also cooperate quite well with other text-processing programs and tools.

1.2 CONT_EXT

The development of $ConT_EXT$ was started in 1990. A number of T_EX based macropackages had been used to our satisfaction. However, the non-technical users at our company were not accustomed to rather complex and non-Dutch interfaces. For this reason we initiated the development of $ConT_EXT$ with a parameter driven interface and commands that are easy to understand. Initially the user interface was only available in Dutch.

The functionality of $CONT_EXT$ was developed during the production of a great number of complex educational materials and workplace manuals and handbooks. In 1994 the package

sea	arch	go) back	exit
K		•		м

was stable enough to warrant a Dutch user manual. Over the years $CONT_EXT$ has been upgraded with many features and German and English interfaces were added. Though $CONT_EXT$ is as (un)stable as any other macropackage there are still a great number of wishes. These will be implemented in the spirit of the existing $CONT_EXT$ commands.

 $CONT_EXT$ comes with a number of PERL scripts, like T_EXUTIL and T_EXEXEC . Also a number of modules are available, like PPCHTEX for typesetting chemical structures.

1.3 Commands

A CONT_EXT document is normally coded in ASCII. Such a document consist of text mixed with CONT_EXT commands. These commands tell the system how the text should be typeset. An example of such a command is s1. A CONT_EXT command begins with a backslash (\). Most of the time a command does something with the text that comes after the command. The text after the command s1 will be typed *slanted*.

When we use a command like \sl we are typesetting. Typesetting and writing are conflicting activities. As an author you would rather spend as little time as possible with typesetting. However, you want to indicate that something has to happen with the text. An example is a command like \em (*emphasis*). Commands like \em enable the typesetter to change the meaning of this command without having to edit the text.

mands. A macro is a, often small, program. Although we will use both 'command' and 'macro', we try to consistently use the word command for users and macro for programmers.

A T_FX user normally speaks of macros instead of com-

A collection of macros is called a macropackage. We believe CONT_{E} XT is one of the most extensive and complete macropackages. One of the advantages of CONT_{E} XT is the availability of most of the plain T_{F} X macros.

A command is often followed by setups or by text. Setups are placed between brackets ([]). The scope or range of the command, the text acted upon, is placed between

curly brackets ({}). For example:

If we process this text and command by T_EX we get:

content	commands	
index	macros	

1.1	T _E X	6
1.2	CONT _E XT	6

M	• • • • • • • • • • • • • • • • • • •	M

1

[\]framed[width=2cm,height=1cm]{that's it}

that's it

Setups in CONT_EXT are defined by commands like:

```
\setupsomething[variable=value,variable=value,...]
```

or

\setupsomething[option,option,...]

In both examples the setups are placed between []. Several setups are defined in a comma list. A number of examples are:

\setupwhitespace[big]

\setupitemize[packed,columns]

```
\setuplayout[backspace=4cm,topspace=2.5cm]
```

There are also commands that are used to define new commands. For example:

```
\definesomething[name]
```

Sometimes a definition inherits its characteristics from another (existing) one. In those situations a definition looks like:

```
\definesomething[clone][original]
```

In many cases one can also pass settings to these commands. In that case a definition looks like:

```
\definesomething[name][variable=value,...]
```

These setups can also be defined in a later stage with:

```
\setupsomething[name][variable=value,...]
```

An example of such a name coupled definiton and setup is:

```
\definehead[section][chapter]
```

```
\setuphead[section][textstyle=bold]
```

The alternatives shown above are the most common appearances of the commands. But there are exceptions:

```
\defineenumeration[Question][location=inmargin]
```

```
\useexternalfigure[Logo][FIG-0001][width=4cm]
```

```
\definehead[Procedure][section]
```

```
\setuphead[Procedure][textstyle=slanted]
```

K			

After the first command the newly defined command \Question is available which we can use for numbered questions and to place numbers in the margin. With the second command we define a picture that is scaled to a width of 4cm. After the third command a new command \procedure is available that inherits its characteristics from the predefined command \section. The last command alters the characteristics of the newly defined head. Later we will discuss these commands in more detail.

Many typographical operations are performed on a text that is enclosed within a start-stop construction:

 \startsomething

\stopsomething

Often keywords or key-value pairs can be passed, that inform CONT_EXT on the users wishes:

\startnarrower[2*left,right]

\stopnarrower

or

\startitemize[n,broad,packed]
\item
\item
\ ctopitomizo

\stopitemize

We use **begin-end** constructions to mark textblocks. Marked textblocks can be typeset, hidden, replaced or called up at other locations in the document.

\beginsomething

\endsomething

These commands enable the author to type questions and answers in one location and place them at another location in the document. Answers could be placed at the end of a chapter with:

\defineblock[Answer]
\setupblock[Answer][bodyfont=small]
\hideblocks[Answer]

\chapter{.....}

1

\beginofAnswer

\endofAnswer

In this case answers will be typeset in a smaller bodyfont size, but only when asked for. They are hidden by default, but stored in such a way, that they can later be typeset.

Commands come in many formats. Take for example:

\placefigure
[left]
[fig:logo]
{This is an example of a logo.}
{\externalfigure[Logo]}

This command places a picture at the left hand side of a text while the text flows around the picture. The picture has a reference fig:logo, i.e. a logical name. The third argument contains the title and the fourth calls the picture. In this case the picture is a figure defined earlier as Logo. Figure 1.1 is typeset this way.

The last example has arguments between optional brackets ([]). Many commands have optional arguments. In case these optional arguments are left out the default values become operative.

You may have noticed that a spacy layout of your ASCII text is allowed. In our opnion, this increases readability considerably, but you may of course decide to format your document otherwise. When the $CONT_EXT$ commands in this manual are discussed they are displayed in the following way:

\set	upfootertexts[.1.][.2.][.3.]	95
.1. .2. .3.	<u>text</u> margin edge <i>text section</i> date <i>mark</i> pagenumber <i>text section</i> date <i>mark</i> pagenumber	

The command \setupfootertexts, which we will discuss in detail in a later chapter, has three arguments of which the first is optional. The first argument defaults to [text]. Optional arguments are displayed as *slanted* text. Default values are <u>underlined</u> and possible alternatives are typeset *slanted*. In this example *text* means that you can provide any footertext. CONT_EXT

M	A A	M

is able to keep track of the status of information on the page, for instance the name of the current chapter. We call this kind of information *mark*, so the command \setupfootertexts accept references to marks, like those belonging to sectioning commands: chapter, section, etc. The argument date results in the current systemdate.

When the setup of some commands are displayed you will notice a $\blacktriangleright \blacktriangleleft$ in the right hand top corner of the frame. This indicates that this command has a special meaning in interactive or screen documents. Commands for the interactive mode only show solid arrows, commands with an additional functionality show gray arrows.

1.4 **Programs**

 T_EX does a lot of text manipulations during document processing. However, some manipulations are carried out by T_EXUTIL . This program helps T_EX to produce registers, lists, tables of contents, tables of formulas, pictures etc. This program is a PERL script.

Document processing can best be done with T_EXEXEC . This PERL script enables the user to use different processing modes and to produce different output formats. It also keeps track of changes and processes the files as many times as needed to get the references and lists right.

1.5 Files

 T_EX is used with ASCII source files. ASCII is an international standardized computer alphabet. The ASCII file with the prescribed extension tex is processed by T_EX . During this process T_EX produces a file with graphical commands. This file has the extension dvi. A machine-specific driver transforms this file into a format that is accepted by photosetters and printers. Usually, POSTSCRIPT drivers are used to produce POSTSCRIPT files.

CONT_EXT relies on plain T_EX. Plain T_EX, CONT_EXT and a third package T_AB_LE are brought together in a so called format file. T_AB_LE is a powerful package for typesetting tables. A format file can be recognized by its suffix fmt. T_EX can load format files rather fast and efficiently.

A dvi file can be viewed on screen with a dedicated program. For electronic distribution POST-SCRIPT files can be transformed (distilled) into Portable Document Format (PDF) files. PDF files are of high graphical quality and are also interactive (hyperlinked). $CONT_EXT$ fully supports PDFT_EX, which means that you can generate PDF output directly.

1.6 Texts

1.6.1 Characters

A T_EX text contains ASCII characters. Higher ASCII values to produce characters like \ddot{e} , \hat{o} and \tilde{n} can also be used in this version of T_EX. Some characters in T_EX have a special meaning. These characters can be typeset by putting a \ in front of it. A % is obtained by typing \%. If one would type only a % the result would be undesirable because T_EX interprets text after a % as comment that should not be processed. A \$ is produced by \\$. A \$ without a \ indicates the beginning of the mathemathical mode.

1.6.2 Paragraphs

 T_EX performs its operations mostly upon the text element *paragraph*. A paragraph is ended by \par or preferably by an empty line. Empty lines in an ASCII text are preferred because of readability.

1.6.3 Boxes

In this manual we will sometimes talk about boxes. Boxes are the building blocks of T_EX . T_EX builds a page in horizontal and vertical boxes. Every character is a box, a world is also a box built out of a number of boxes, a line is ...

When T_EX is processing a document many messages may occur on the screen. Some of these messages relate to overfull or underful boxes. Horizontal and vertical boxes can be typeset by the T_EX commands \hbox and \vbox. Displacements can be achieved by using \hskip and \vskip. It does not hurt to know a bit about the basics of T_EX , because that way one can far more easily write his or her own alternatives to, for instance, chapter headers.

1.6.4 Fonts

 T_EX is one of the few typesetting systems that does math typesetting right. To do so T_EX needs a complete fontfamily. This means not only the characters and numbers but also the mathematical symbols. Complete fontfamilies are Computer Modern Roman and Lucida Bright. Both come in serif and sans serif characters and a monospaced character is also available. Other fontfamilies are available.

1.6.5 Dimensions

Characters have dimensions. Spacing between words and lines have dimensions. These dimensions are related to one of the units of table 1.1. For example the linespacing in this document is 14.83998pt.

mm	millimeter	10mm = 1cm
dd	didot point	1157dd = 1238pt
сс	cicero	1cc = 12dd
sp	scaled point	65536sp = 1pt

Table 1.1Dimensions in T_EX.

We will often specify layout dimensions in points or centimeters or milimeters. A point is about .35mm. Most dimensions are rather American. The European Didot point is equivalent to 1/2660m = 3.759398496mm.

Next to the mentioned dimension T_EX also uses em and ex. Both are font dependant. An ex has the height of an x, and an em the width of an M. In the Computer Modern Roman typefaces, numbers have a width of 1/2em, while a -(--) is one em.

1.6.6 Error messages

While processing a document, T_EX generates status messages (what is T_EX doing), warning messages (what could T_EX do better) and error messages (what considers T_EX wrong). An error message is always followed by a halt and processing will be stopped. A linenumber and a ? will appear on screen. At the commandline you can type H for help and the available commands will be displayed.

Some fatal errors will lead to an * on the screen. T_EX is expecting a filename and you have to quit processing. You can type stop or exit and if that doesn't work you can always try ctrl-z or ctrl-c.

1.7 Version numbers

 $T_{E}X$ was frozen in 1982. This meant that no functionality would be added from that time on. However, exceptions were made for the processing of multi-language documents, the use of

1.1	T _E X	6

1.9	Warning	14

8-bits ASCII-values and composed characters. Additionally some bugs were corrected. At this moment T_EX version 3.141592 is being used. The final T_EX version number will be π , while METAFONT will become the Euler number *e*.

ConT_EXT can handle both ϵ -T_EX and PDFT_EX, which are extensions to T_EX. Both are still under development, so we suggest using the latest versions available. This manual is typeset using PDF- ϵ -T_EX, with ϵ -T_EX version 2.1 and PDFT_EX version 14h.

 $CONT_EXT$ is still under development. Macros are continually improved in terms of functionality and processing speed. Improvements are made within existing macros. For example the possibility to produce highly interactive PDF documents has altered some low-level functionality of $CONT_EXT$ but did not alter the interface. We hope that in due time $CONT_EXT$ will be a reasonable complete document processing system, and we hope this manual shows enough of its possibilities. This document was processed with version 2001.11.5.

1.8 Top ten

A novice user might be shooed away by the number of $CONT_EXT$ commands. Satisfying results can be obtained by only using the next ten groups of commands:

- 1. \starttext, \stoptext
- 2. \chapter, \section, \title, \subject, \setuphead, \completecontent
- 3. em, bf, cap
- 4. \startitemize, \stopitemize, \item, \head
- 5. \abbreviation, \infull, \completelistofabbreviations
- 7. \placetable, \starttable, \stoptable
- $8. \quad \verb|definedescription, \verb|defineenumeration|| \\$
- 9. $\$ (index, $\$ completeindex
- 10. $\setuplayout, \setupfootertexts, \setupheadertexts$

1.9 Warning

ConT_EXT users can define their own commands. These newly defined commands may conflict with plain T_EX or $ConT_EXT$ commands. Therefore it is advisable to use capital characters in your own command definitions.

Documents

2.1 Introduction

Why should one use T_EX in the first place? Many people start using T_EX because they want to typeset math. Others are charmed by the possibility of separating content and make-up. Yet another kind of user longs for a programmable system. And let us not forget those users that go for quality.

When using T_EX one does not easily run into capacity problems. Typesetting large documents with hundreds of pages is typically a job for T_EX . If possible, when coding a document one should look beyond the current document. These days we see documents that were originally typeset for paper being published in electronic format. And how about making a stripped version of a 700 page document? A strict separation between content and layout (make-up) on the one hand and an acceptable redundancy in structure on the other is often enough to guarantee multiple use of one document source.

A system like $ConT_EXT$ is meant to make life easier. When coding a document the feeling can surface that "this or that should be easier". This feeling often reflects the truth and the answer to the question can often be found in this manual, although sometimes obscured. It takes some time to learn to think in structure and content, certainly when one is accustomed to mouse driven word processors. In this chapter we focus on the structure of collections of documents.

2.2 Start and stop

In a self contained text we use the following commands to mark the begin and end of a text:

\starttext

\stoptext

The first command takes care of a number of initializations and the last command tells T_EX that processing can stop. When this command is left out T_EX will display a * (a star) on the command line at the end of the job. T_EX will expect a command, for example \end.

It is advisable to type the document setups before the \start-command, the so called setup area of the document. In this way a clever word-processor can identify where the text starts, and therefore can include those setups when it partially processes the document, given of course that it supports partial processing of files.

In the example below a very simple layout is being used.

 \starttext

\subject{Introduction}

\unknown\ America has always been a land set firmly not in the past, but in the future. On a recent visit to England, I found dozens of wonderful bookstores chock full of the past --- ancient history, rooms full of it, and great literature in such monumental stacks as to be overwhelming. In the usual American bookstore, history might occupy a few bookcases; great literature has its honoured place, but this year's paperbacks dominate. The past is not disregarded, but neither does it loom so large and run so deep in our blood.

\b]ank

{\bf Greg Bear, introduction to Tangents (1989).}

\stoptext

The commands \starttext...\stoptext may be nested. Within a text a new text containing \starttext and \stoptext may be loaded.

2.3 Structure

In this section a structured approach of managing your documents is discussed. For very simple and self containing documents you can use the following approach:

\environment this \environment that

\starttext

... some interesting text ...
\stoptext

When you have to typeset very bulky documents it is better to divide your document in logical components. $ConT_EXT$ allows you to setup a project structure to manage your texts. You have to know that:

- A group of texts that belong together have to be maintained as a whole. We call this a *project*.
- Layout characteristics and macros have to be defined at the highest level. For this, the term *environment* has been reserved.

content	commands
index	macros

2.1	Introduction	17

K	•	M

18

- Texts that belong together in a project we call *products*.
- A product can be divided into components, these components can be shared with other products. Components can be processed individually.

Programmable word processors can be adapted to this structure.

A *project*, *environment*, *product* or *component* is started and stopped with one of the following commands:

```
\startproject ... \stopproject
... file
\startproduct ... \stopproduct
... file
\startenvironment ... \stoppenvironment
... file
\startcomponent ... \stopcomponent
... file
```

Before a start-stop-pair commands can be added. When a file is not found on the directory CONT_EXT looks for the files on higher level directories. This enables the user to use one or more environments for documents that are placed on several subdirectories.

command	project	environment	product	componnent
\project <i>name</i>			*	*
\environment <i>name</i>	(*)	(*)	(*)	(*)
\product <i>name</i>	*			(*)
\componentonderdeel <i>name</i>			(*)	(*)

Table 2.1 The structure commands that can be used in the files that make up a project.

2.1 2.2 2.3	Introduction Start and stop Structure	17 17 18
 2.3 2.4 2.5 2.6 	Directories Versions Modes	23 23 24

2

To treat products and components as individual documents, the commands in table 2.1 are used. The commands marked with \star are obligatory and the commands marked with (\star) are optional. The content is typed before the \stop command.

\startproject documents	An example of a project file.
\environment layout	T T T T T
\product teacher \product pupil \product curriculum	
\stopproject	
<pre>\startproduct teacher \project documents \component teacher1 \component teacher2</pre>	The product teacher.tex (a teacher manual) can be defined as shown on the opposite site.
\stopproduct	
\startcomponent teacher2	Here we see the component.
\project documents \product teacher	
text	
\stopcomponent	

In most cases working with only \starttext and \stoptext in combination with \input or \environment is sufficient. A project structure has advantages when you have to manage a great number of texts. Although it is more obvious to process *products* as a whole, it also enables you to process *components* independently, given that the stucture is defined properly.

In principal a project file contains only a list of products and environments. If you would process the project file all products will be placed in one document. This is seldom wanted. This manual for example has a project structure. Every part is a product and every chapter is a component. There are several environments that are loaded in the main project file.

Schematically the coherence between files could be displayed as illustrated in figures 2.1, 2.2 and 2.3.

Documents

content commands index macros

Figure 2.1 An example of project structure.

Figure 2.2 An example with only products.

Figure 2.3 An example with only one component.

It is good practice to put all setups in one environment. In case a component or product has a different layout you could define *localenvironments*:

\startlocalenvironment[names]

```
\stoplocalenvironment
```

2.1	Introduction	17
2.2	Start and stop	17
2.3	Structure	18
2.4	Directories	23
2.5	Versions	23
2.5	Versions	23
2.6	Modes	24
2.0	Modes	24

search	go back	exit
м	•	M

A local environment can be typed in an environment file or is a separate file itself. When a separate file is used the local environment is loaded with:

\localenvironment *name*

\completeindex
\stopcomponent

Below you will find an example of a project structure.

\startproject demos	file: demos.tex
\product example	This file is used to define the products and environ-
\stopproject	ments.
\startenvironment environ	file onvinen tov
\setupwhitespace[big]	me. environ. Lex
\setupfootertexts[part][chapter]	In the environment we type the setups that relate to all
\stopenvironment	the different products. More than one environment or
	local environments per product can be used.
\startproduct example	file: example.tex
\project demos	
\startfrontmatter	The product file contains the structure of the product.
\stopfrontmatter	Because indexes and registers can be evoked quite easily
\startbodymatter \component first \component second	we do not use a separate file.
\startbackmatter	
\completeindex	
\stopbackmatter	
\stopproduct	
\startcomponent first	flow first toy
\part{One}	me. Thist.tex
\completecontent	In the components of a product we place the textual
\chapter{First}	content, figures etc. It is also possible to request the
text	tables of content and registers per product.
\chapter{Second}	
text	

2.1	Introduction	17

content commands index macros

\startcomponent second
\part{Two}
\completecontent
\chapter{Alfa}
text
\chapter{Beta}
text
\completeindex
\stopcomponent

file: second.tex

The product contains more than one component. We could have defined a product for each part and a component for each chapter.

The files first.tex, second.tex and example.tex can be processed separately. As long as there is one product in this project you can also process project.tex. If you process an environment there will be no pages of output.

2.4 Directories

Many T_EX implementations look for a file in all directories and subdirectories when a requested file is not in the current directory. This is not only time-consuming but may lead to errors when the wrong file (a file with the same name) is loaded.

For this reason $CONT_EXT$ works somewhat differently. A file that is not available on the working directory is searched for on the parent directories. This means that environments can be placed in directories that are parents to the products that use them. For example:

/texfiles/course/layout.tex
/texfiles/course/teacher/manual.tex
/texfiles/course/student/learnmat.tex
/texfiles/course/otherdoc/sheets.tex

The last three files (in different subdirectories) all use the same environment layout.tex. So, instead of putting all files into one directory, one can organize them in subdirectories. When a project is properly set up, that is, as long as the project file and specific environments can be found, one can process components and products independently.

2.5 Versions

During the process of document production it is useful to generate a provisional version. This version shows the references and the typesetting failures. The provisional version is produced when you type:

2.1	Introduction	17
2.2	Start and stop	17
2.3	Structure	18
2.4	Directories	23
2.5	Versions	23
2.6	Modes	24

content commands index macros

\version[...]

... <u>final</u> concept temporary

By default the definitive version is produced. In case a preliminary version is produced the word *concept* is placed at the bottom of each page. The keyword temporary shows some information on for instance overfull lines, references, figure placement, and index entries. Most messages are placed in the margin. In some cases these messages refer to the next pages because T_EX is processing in advance.

2.6 Modes

 $T_{E}X$ can directly produce DVI or PDF. A document can be designed for paper and screen, where the last category often has additional functionality. From one document we can generate different alternatives, both in size and in design. So, from one source several alternatives can be generated.

Processing a file in practice comes down to launching T_EX with the name of the file to be processed. Imagine that by default we generate DVI output. Switching to PDF is possible by enabling another output format in the file itself or a configuration file, but both are far from comfortable.

```
\setupoutput[pdftex]
```

for direct PDF output, or for PDF produced from POSTSCRIPT:

```
\setupoutput[dvips,acrobat]
```

The key to the solution of this problem is $T_{E}XEXEC$. This PERL script provides CONT_EXT with a command-line-interface. When we want PDF instead of DVI, we can launch $T_{E}XEXEC$ with:

```
texexec --pdf filename
```

There are more options, like making A5-booklets; more on these features can be found in the manual that comes with $T_{E}XEXEC$. However, one option deserves more time: modes.

```
texexec --pdf --mode=screen filename
```

The idea behind modes is that within a style definition, at each moment one can ask for in what mode the document is processed. An example of a mode dependant definition is:

```
\startmode[screen]
  \setupinteraction[state=start]
```

2.1	Introduction	17
2.2	Start and stop	17
2.3	Structure	18
2.4	Directories	23
2.5	Versions	23
2.6	Modes	24

search		go	back	exit	
	M	. +			M

\	setupcolors[state=start]
\ _ +	

\stopmode

if needed, accompanied by:

```
\startnotmode[screen]
```

```
\setupcolors[state=start,conversion=always]
```

\stopnotmode

One can also pass more than one mode, separated by comma's. There are also some low level mode dependant commands. Given that we are dealing with a screen mode, we can say:

\doifmodeelse {screen} {do this} {and not that}
\doifmode {screen} {do something}
\doifnotmode {screen} {do something else}

A mode can be activated by saying:

```
\enablemode[screen]
\disablemode[screen]
```

Again, we can pass more modes:

```
\ensuremath{ (paper,A4] }
```

One strength of $T_{E}XEXEC$ is that one is not forced to enable modes in a file: one can simply pass a command line switch. Just as with choosing the output format: the less we spoil the document source with output and mode settings, the more flexible we are.

To enable users to develop a style that adapts itself to certain circumstances, $ConT_{E}XT$ provide system modes. For the moment there are:

*list the list one called for is placed indeed

*register the register one called for is placed indeed

*interaction interaction (hyperlinks etc) are turned on

*sectionblock the named sectionblock is entered

System modes are prefixed by a *, so they will not conflict with user modes. An example of a sectionblock mode is *frontmatter. One can use these modes like:

```
\startmode[*interaction]
  \setuppapersize[S6][S6]
  \stopmode
```

Page design

3.1 Introduction

While processing a text T_EX makes use of the actual \hsize (width) and \vsize (height). As soon as \vsize is exceeded T_EX 's output routine is launched. The output routine deals with the typeset part — most of the time this will be a page. It takes care of typesetting the headers and footers, the page number, the backgrounds and footnotes, tables and figures. This rather complex process makes it obvious that the output routine actually makes use of more dimensions than \hsize and \vsize.

3.2 Paper dimensions

With the command \setuppapersize the dimensions of the paper being used are defined. There is a difference between the dimensions for typesetting and printing.

\setuppapersize[..,.1.,..][..,.2.,..]

- .1. A3 A4 A5 A6 letter ... CD name landscape mirrored rotated 90 180 270
- .2. A3 A4 A5 A6 letter ... name landscape mirrored rotated negative 90 180 270

The dimensions of DIN formats are given in table 3.1.

format	size in mm	format	size in mm
A0	841 imes 1189	A5	148×210
A1	594×841	A6	105 imes 148
A2	420×594	A7	74 imes 105
A3	297×420	A8	52×74
A4	210×297	A9	37×52

Table 3.1Default paper dimensions.

Other formats like BO-B9 and CO-C9 are also available. You could also use: letter, legal, folio and executive, envelop 9-14, monarch, check, DL and CD.

sear	ch	:	go ba	ack	exit
M					 M

3.1	Introduction	27
3.2	Paper dimensions	27
3.3	Page composition	28
3.4	Grids	41
3.5	Printing	44
3.6	Arranging pages	47
3.7	Logo types	57

A new format can be defined by:

```
\definepapersize[...][..,.=..,.]
```

... name width dimension height dimension offset dimension scale number

For example CD was defined as:

\definepapersize[CD][width=12cm,height=12cm]

After defining CD you can type:

\setuppapersize[CD][A4]

This means that for typesetting $CONT_EXT$ will use the newly defined size CD. The resulting, rather small page, is positioned on an A4 paper size. This second argument is explained in detail later.

 $CONT_EXT$ can also be used to produce screen documents. For that purpose a number of screen formats are available that relate to the screen dimensions. You can use: S3–S6. These generate screens with widths varying from 300 to 600 pt and a height of 3/4 of the width.

When one chooses another paper format than A4, the default settings are scaled to fit the new size.

3.3 Page composition

In page composition we distinguish the main text area, headers and footers, and the margins (top, bottom, right and left). The main text flows inside the main text area. When defining a layout, one should realize that the header, text and footer areas are treated as a whole. Their position on the page is determined by the topspace and backspace dimensions (see picture 3.1).

The header is located on top of the main text area, and the footer comes after it. Normally, in the header and footer page numbers and running titles are placed. The left and/or right margin are often used for structural components like marginal notes and/or chapter and

left section numbers. The margins are located in the backspace. Their width has *no* influence on the location of the typesetting area on the page.

3.4	Grids	41
3.5	Printing	44
3.6	Arranging pages	47
3.7	Logo types	57

occasionally hides the header or footer, this guarantees a consistent layout.

The dimensions and location of all those areas are set up with \setuplayout.

Setting up the left or right margin has no influence on the typesetting area. In paper documents this parameter is only of use when keywords or other text are placed in the margin (hyphenation).

In paper documents it is sufficient to set up the height, header, footer, top space and back space. In electronic documents and screen documents however we need some room for navigational tools (see chapter ??). In screen documents it is common practice to use backgrounds. Therefore it is also possible to set up the space between the text area and the header and footer on a page, and thereby visually separating those areas.

It is possible to trace the setting by using the following commands:

```
\showframe[...]
```

```
... text margin edge
```

The dimensions can be displayed by:

\showsetups

A multi-page combination of both is generated with:

\showlayout

The width of a text is available as \hsize and the height as \vsize. To be on the safe side one can better use the \dimen-registers \textwidth and \textheight, \makeupwidth and \makeupheight.

When we are typesetting in one column of text \textwidth and \makeupwidth are identical. In case of a two columned text the \textwidth is somewhat less than half the makeupwidth. The \textheight is the \makeupheight minus the height of the header and footer.

There are also other dimensions available like \leftmarginwidth and \footerheight, but be aware of the fact that you can only use these variables, you can not set them up. The width of a figure could for instance be specified as width=.9\leftmarginwidth.

In principal documents are typeset automatically. However, in some cases the output would become much better if a line would be moved to another page. For these situations you can adjust the layout momentarily (just for that page) by typing:

3.1	Introduction	27
3.2	Paper dimensions	27
3.3	Page composition	28
3.4	Grids	41
3.5	Printing	44
3.6	Arranging pages	47
3.7	Logo types	57

search	go back	exit
M	< >	M

```
\adaptlayout[..,...][..,.=..,.]
... number
height dimension max
lines number
```

The use of these commands should be avoided because if you alter your document the adjustment would not be necessary anymore. So, if you use this command, use it at the top of your document. For example:

```
\adaptlayout[21,38][height=+.5cm]
```

The layout of page 21 and 38 will temporarily be 0.5 cm higher though the footer will be maintained at the same height. The numbers to be specified are the numbers in the output file.

If the layout is disturbed you can reset the layout by:

\setuplayout[reset]

In some commands you can set up the parameters width and height with the value fit. In that case the width and height are calculated automatically.

On the next pages we will show a number of A5 page layouts centered on an A4. The default setups (dimensions) are adequate for standard documents like manuals and papers. The setup adjusts automatically to the paper size. Notice the use of middle while setting up the parameters width and height.

Grids

_	This will result in:	_ 1
0.0pt22.25996pt7.41998pt+++	This is like a snapshot.	2 3
-	This mechanism can be influenced with an argument:	5 6
-	<pre>\placeongrid[bottom]{\framed{Do you like the snapshot?}}</pre>	7 8
- - -	Now an empty line will appear below the framed text. Other parameters are: top and both. The last parameter divides the linespace between over and below the framed text.	9 10 11
0.0pt22.25996pt7.41998pt++	Now the snapshot looks better.	12 13 14
-	These examples don't show pretty typesetting. The reason is that $framed$ has no depth because $T_{E}X$ handles spacing before and after a line in a different way than text. Con $T_{E}XT$ has	15 16
_	a solution to this:	
-	\startlinecorrection	 20
	\framed{This is something for hotshots.}	21
_	\stoplinecorrection	22
- - -	The command \startlinecorrection tries to typeset the lines as good as possible and takes the use of grid in account.	23 24 25 26
14.83998pt 14.83998pt 0.0pt 00e	This is something for hotshots.	27 28
-	Because line correction takes care of the grid we have to use yet another command to stretch the framed text:	29 30
-		31
_	\moveongrid[both]	
_	\startlinecorrection	34
	\framed{Anyhow it is good to know how this works.}	35
_	\stoplinecorrection	36

3.5 Printing

In an earlier section we used page and paper dimensions. In this section we will discuss how these two can be manipulated to yield a good output on paper.

In figure 3.10 and 3.11 we see some alternatives to manipulate the page composition by means of \setuppapersize and\setuplayout. So it is possible to put a page in a corner or in the middle of the paper, to copy a page and to use cutting marks.

When the parameter papersize is set to landscape width and height are interchanged. This is not the same as rotation! Rotation is done by typing 90, 180 and 270 in the first argument of \setuppapersize.

```
\setuppapersize[A5,landscape][A4]
```

These examples don't show that we can correct for duplex printing. For example when we type:

```
\setuppapersize[A5][A4]
\setuplayout[location=middle,marking=on]
```

the front and back side will be placed in the middle of the paper. The markings enable you to cut the paper at the correct size. If we only want to cut twice, we type:

```
\setupppapersize[A5][A4]
\setuplayout[location=duplex]
```

This has the same meaning as {duplex,left}. At this setup $ConT_EXT$ will automatically move front and back side to the correct corner. In figure 3.9 we show both alternatives.

Figure 3.9 Positioning the page on paper for cutting.

Rotating, mirroring, scaling, duplicating and placing pages on paper are independent operations. By combining these operations the desired effects can be reached. Rotating and

Printing

mirroring and page and paper size are set up at the same time. The other operations are set up with \setuplayout.

```
\showprint[...,1.,..][...,2.,..][...,=...]
..=.. see p 27: \setuppapersize
..=.. see p 27: \setuppapersize
..=.. see p 32: \setuplayout
```

You can use \showprint to get an idea of how your print will look. However, it is just a representation of the real page as is shown in the examples above.

```
\showprint[mirrored][90][location=middle]
```

3.6 Arranging pages

By means of \setuplayout one can arrange pages on a sheet of paper. A special arrangement for example is that for booklets.

```
\setuparranging[..,...]
```

... disable 2*16 2*8 2*4 2*2 2**2 2UP 2DOWN mirrored rotated doublesided negative 90 180 270

We will show some page arrangements on the next pages. If you want to understand how it really works you should try this yourself one day.

The next examples show the cooperation of the commands \setuppapersize, \setuplayout and \setuparranging. Notice how these tests were generated.

Layout

4.1 Introduction

The look of a publication is determined by the page design, the chosen fonts and other aspects like vertical spacing. In this chapter we will explore the latter. Sometimes we will go into detail but a novice user can skip such parts. In normal applications, the default setups are most adequate, because they will adapt to the different situations. For the impatient reader we will just mention a few setups. Spacing between paragraphs is defined by:

\setupwhitespace[big]

In your source file you can best use an empty line between paragraphs. This increases readability and it makes the typing of \par at the end of each paragraph obsolete. Indentation at every new paragraph is obtained by:

\setupindenting[medium]

A doublesided publication is generated when you type:

\setuppagenumbering[alternative=doublesided]

As you might expect this might generate page numbering on the right and left hand side of a paper and the margins will be mirrored automatically.

As we have said before only the curious have to read on.

4.2 Paragraphs

The most important unit in T_FX is paragraph. A new paragraph is forced by:

- 1. an empty line
- 2. the T_EX-command\par or \end{graf}
- 3. the CONT_EXT-command \paragraph

The first alternative is the most obvious. You will obtain a readable input file (ASCII file) and errors are minimized. The second alternative is chosen when it is mandatory to the used command. For example in definitions (see 10.2).

4.3 Line spacing

+ ____ =

In T_EX linespacing is determined by a number of variable dimensions like \topskip, \parskip and \baselineskip. However, in Con T_EXT these variables are related to the bodyfont size.

A line has a height and a depth. The distance between two lines is normally equal to the sum of the maximum height and maximum depth:

This sum is in $CONT_EXT$ equal to 2.8ex, so almost three times the height of an x. This is about $1.2 \times$ the bodyfont height. The proportion between maximum height and depth is default .72 : .28. Linespacing alters when a new bodyfont is used or when linespacing is defined explicitly by:

 $bfd \ setupinterlinespace Now, the interline spacing is larger ... \par$

One has to consider the fact that T_EX operates on paragraphs and within a group one has to close the paragraph explicitly with an empty line or \par. However, in most cases $ConT_EXT$ will take care of this.

Sometimes a line does not have the maximum height or depth. The next example illustrates this:

يعيالنا ويصالد البهية المركيهية يتلا

It says:

The height and depth of lines differs.

When we put two of these lines above each other we will get:

You can see that the distance is somewhat bigger that the sum of the height and depth of each separate line. This distance is called the baseline distance (\baselineskip) and is in this document 14.83998pt. If we add some extra height to the line we see this:

To prevent the lines from touching T_EX adds a \lineskip, in our example 1.0pt. In a similar way T_EX is taking care of the first line of a page to have at least a height of \topskip (here 10.6848pt).

4.1	Introduction	62

Layout

Linespacing is setup by:

```
\setupinterlinespace[...] [..,.=..,..]
```

```
... reset <u>small</u> medium big on off
height number
depth number
line dimension
top number
bottom number
```

Linespacing adapts to the size of the actual bodyfont automatically. This means that the user can leave this command untouched, unless a different linespacing is wanted. Instead of a factor one of the predetermined values small (1.0), medium (1.25) or big (1.5) can be given. Below an example is given of a text with a linespacing of 1.25: \setupinterlinespace[medium].

Whenever it comes to my mind that "everything that comes in quantities, will somehow survive", I also got the feeling that in a few hundred years people will draw the saddening conclusion that all those top-ten hits produced by computers represent the summum of todays musical and instrumental abilities. Isn't it true that archeologists can spend a lifetime on speculating about some old coins from the first century? On the other hand, the mere fact that one can have success with this type of non-music success of some top-hit musicians demonstrates both the listeners inability to rate the product and the lack of self criticism of the performers. In principle the future archeologist will therefore draw the right conclusion.

When you make a fontswitch the linespacing is adapted when you type the command \setupinterlinespace without set up parameters or by adding reset, for example: [reset,medium].

In books meant for children we often find a somewhat bigger typeface, for instance because we are convinced that this enables them to read the book themselves. On the other hand, I can also imagine that it is a cheap way to increase the number of pages. Unfortunately scaling up will also uncover the lack of quality of the typesetting used and/or the lack of typographic knowledge of the user of such a system. The interline space sometimes differs on a line by line basis, and depends on the **height** of the current line.

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and

4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

content commands index macros

Therefore, when changing the style, something that should only be done on purpose, also change the baseline distance when needed.

The text above is typeset in the fontsize \tfa which equals \rma (see also chapter 5).

 $\tart tfa \setupinterlinespace In books meant for children we often find a somewhat ... when needed. \\par \\stop$

In this example the par is necessary because otherwise T_EX will have forgotten the linespacing before the paragraph is finished (in that case, the paragraph is ended by the empty line after the stop).

Instead of a keyword, one can pass a key-value pair to define the characteristics of a line. The default settings are:

\setuplinespacing
[height=.72,
 depth=.28,
 top=1.0,
 bottom=0.4,
 line=2.8ex]

The height and depth determine the ratio between the height and depth of a line. The baseline distance is set to 2.8ex. The parameters top and bottom specify the relation between the bodyfont size and the height of the first line and the depth of the last line on a page. The last two quantities are related to T_FX 's \topskip and \maxdepth.

4.4 Indentation

When a text has little whitespacing, for example in a novel, it is a custom to indent each new paragraph. Indentation is setup with:

```
\setupindenting[..,...,..]
```

```
... <u>none</u> small medium big next first dimension
```

By default there is 'no' indentation. When indentation is turned on, when possible the commands will determine whether indentation is necessary. For example, it doesn't look good to indent after a vertical whitespace. In a number of cases it is even undesirable to indent. Think for example of headers and itemizations.

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and	
	superscript	76

4.17	Headers and footers	94
4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

This manual is typeset without indentation. The great quantity of short sentences and examples would result in a very messy page layout.

When indentation is used, we may have to tell T_EX in some cases *not* to indent. This is done by:

\noindenting

We can set up indenting by:

\indenting[...,...]

... <u>never</u> not no yes always first next

The meaning of the setups is described in table 4.1. Next to the commands described above we could use the T_{EX} -commands \indent and \noindent.

setup	result
no/not	don't indent the next paragraph
yes/always	turn on indentation
never	turn off indentation
first	indent first paragraphs too
next	don't indent first paragraphs

Table 4.1The way of indenting.

The settings first and next determine if paragraphs following whitespace should be indented or not. It is a sort of custom not to indent these.

A text my be typeset smaller than the default textwidth. In that case the complete text will be indented on both sides.

\startnarrower[...,...] ... \stopnarrower
... n*left n*middle n*right

For example:

4.1	Introduction	62
4.2	Paragraphs	62

\startnarrower[3* ⁻	left,2	?*rig	nt]
--------------------------------	--------	-------	-----

The relatively small revolution in in Russia in 1917 had big consequences for this country as well as the rest of the world. It is interesting to see that some 80°years later a just as small revolution was needed to undo the 1917 one. In both cases, the main reason for the revolutions was to prevent democracy to arise.

\stopnarrower

Will become:

The relatively small revolution in Russia in 1917 had big consequences for this country as well as the rest of the world. It is interesting to see that some 80 years later a just as small revolution was needed to undo the 1917 one. In both cases, the main reason for the revolutions was to prevent democracy to arise.

Next to using left, right and middle also combinations and manifolds are possible. Indentation in the example above could have obtained by typing 2*middle,left. So, middle is equivalent to left,right.

The value of indentation is set up by:

\setupnarrower[..,.=..,.]
left dimension
right dimension
middle dimension

4.5 Vertical spacing (whitespacing)

Vertical spacing between paragraphs is set up by:

```
\setupwhitespace[...]
```

... <u>none</u> small medium big line fixed fix *dimension*

Instead of a random value it is better to use one of the pre defined dimension. Default there is no vertical spacing. Without any set up values the vertical spacing is related to the actual fontsize.

Layout

Vertical spacing can be forced by either:

\whitespace

\nowhitespace

These commands have only effect when vertical spacing is set up. In fact these commands will not be necessary for $CONT_{E}XT$ takes care of most situations.

 T_EX handles vertical spacing around lines quite different from that around text. In case these problematic situations occur one can use the following commands. Spacing around figures and tables is dealt with by CONTEXT, so only use these commands when the typeset text looks really bad.

\startlinecorrection ... \stoplinecorrection

For example:

\startlinecorrection
\framed{To boxit or not, that's a delicate question!}
\stoplinecorrection

One can add vertical spacing with the T_EX command \vskip , but please don't. We advise you to use:

We can use a value of one of the keywords small, medium or big. A big jump is twice a medium jump which is four times a small jump. A value however can be left out (\blank) when the default vertical space is desired. It is advisable to set up the vertical spacing only once in the setup area of your document. Local alterations throughout your document will result in a badly-spaced document.

Normally there is some stretch in the vertical spacing. This enables T_EX to fill out a page optimally. In the next example we see what happens when we add stretch to whitespace. Each

[\]blank[...,...]

^{...} *n**small *n**medium *n**big nowhite back white disable force reset line halfline formula fixed flexible

sample shows from top to bottom three \blank's of big, medium and small. The left and right sample show the range of the stretch. The rightmost sample shows that adding stretch can result in shrink.

maximum stretch

no stretch

minimal stretch

The last vertical space can be undone by typing \blank[back] and the next blank can be blocked by disable. With reset a disable is ignored.

The command \blank is one of the more advanced commands. The next call is allowed:

```
\blank[2*big,medium,disable]
```

Since medium is half the amount of big, this results in adding a vertical spaces of 2.5 times big. The previous vertical space will be undone automatically and the disable suppressed the next \blank.

A lasting vertical space can be sustained by **force**. For example, if you want some extra spacing at the top of a page you will have to type **force**.

The default vertical spaces are set up with:

· · · · · ·	~		-
\setupblank	1.		- 1
(00000.00.00.00.00.00.00.00.00.00.00.00.	· L -	-	

... <u>normal</u> standard line *dimension* big medium small fixed flexible

An example of such a definition is:

\setupblank[big]

The vertical spaces will be automatically adapted to the fontsize and they are flexible. Changing the default set up locally is therefore not advisable. Without an argument \setupblank adapts to the actual fontsize!

The keywords fixed and flexible are used to end or reinstate this adaptive characteristic. In columns it is recommended to use the setup [fixed,line] or the opposite setup [flexible,standard].

This text is typeset a bodyfont of 10pt and is downscaled by a few percent. The setup that is used in this document is shown in table 4.2. We see some stretch in the vertical spacing. The stretching enables T_EX to fill out a page satisfactorily. Default the maximal vertical space is 75% of the line space and the stretch maximal of 25%.

big	11.12997pt plus 3.70999pt minus 3.70999pt
line	14.83998pt

Table 4.2 The whitespace values to a 10pt bodyfont.

In paragraph ?? it was said that the vertical spacing can be set up with the command \setupwhitespace. Default there is no whitespace between paragraphs. The setup of vertical spacing and line spacing are related to each other.

Instead of direct setup you can use an indirect way. This has the advantage that you can change the layout more easily. In that case we use:

\defineblank[.1.][.2.]

```
.1. name
```

```
.2. see p 69: \setupblank
```

If we type for example:

\defineblank[aroundverbatim][medium]

than aroundverbatim is equal to medium, which can be used, for example around verbatim, as in:

\setuptyping

```
[before={\blank[aroundverbatim]},
    after={\blank[aroundverbatim]}]
```

If we want some more whitespacing we only have to change the definition of aroundverbatim:

```
\defineblank[aroundverbatim][big]
```

The vertical spacing between two lines can be suppressed with the command:

packed

Vertical spacing between more than one line is suppressed by:

V

/ertical spacing (whitespacing)
--------------------	---------------

4.1	Introduction	62

4.19	Aligned boxes	103
4.20	Makeup	105

\startpacked[...] ... \stoppacked

... blank

The spacing around 'packed' text is automatically corrected. Opposed to this command is:

\startunpacked ... \stopunpacked

Skipping more than one vertical space is done with:

```
godown[...]
```

```
... dimension
```

One of the most important lessons to be learned is to avoid using $\sin kip$ in running text. This can interfere with some hidden mechanisms of CONT_EXT.

Sometimes T_EX is not able to sort out spacing on its own. In such situations one can insert the next command at the troublesome location.

```
\correctwhitespace{...}
```

Normally one will not need this command, although sometimes when writing macros, it can be added to make sure that the spacing is okay. Use this kind of tweaking with care!

4.6 Word spacing

Default a space is placed after a period that ends a sentence. In some countries it is custom to stretch the space after a period. Especially documents typeset in small columns will look better that way. Because this is a language specific feature. the default depends on the language. One can however (temporarily) change this spacing.

```
\setupspacing[...]
... broad packed
```

In many cases we combine words and numbers that should not be separated at linebreaking, for example number 12. These combinations can be connected by a tight space: number ~12.

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and	
	superscript	76
4.10	Columns	77
4.11	Paragraphs in columns	80
4.12	Tabulate	84
4.13	Alignment	86
4.14	New lines	88
4.15	New page	91
4.16	Pagenumbers	92
4.17	Headers and footers	94
4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

Word and number will never be separated at linebreaking on that spot. A space can be made visible by:

\space

Undesired spaces can be suppressed by:

\nospace

When you want to align a row of numbers you can use tight spaces with the width of a number. Tight spaces are activated by:

\fixedspaces

After this command the $\tilde{}$ (tilde) generates a tight space with the width of a number.

Struts

A strut is a little invisible block without width but with the maximal height and depth of a character or line. If you want to force these maximal dimensions, for example when you are using boxes in your own commands, than you can use the command \strut:

\hbox{\strut test}

If we leave out the strut in this example the box has no depth. The characters in the word test don't reach under the baseline. Compare for example test (with strut) with test.

Many commands use struts automatically. If for some reason you don't want struts you can try to suppress them by \setnostrut. However take care that this command works only locally. A strut can be set by \setstrut.

The struts that are used by CONT_EXT can be made visible with the command:

\showstruts

4.8 Text in the margin

Texts can be place in the margins with:

11	Introduction	62
4.1		02
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and	
	superscript	76
4.10	Columns	77
4.11	Paragraphs in columns	80
4.12	Tabulate	84

4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

.1. + - low

.2. text

A new line in a margin text is forced with $\backslash \backslash$. An example of a margin text is:

\inmargin{the marginal\\influence of\\advertisement}It would be great
if the recent reduction in washing powder needed to get your wash
perfectly clean had resulted in an equal reduction of time needed to
advertise this kind of products.

or:

the marginal influence of advertisement

over here

When this command is used in the middle of a paragraph the margin text will appear on the same line in themargin. The command \inmargin puts the text in the left or right margin. The location where the text will show up depends on the character of the document: single-sided or double-sided. You can also force the text into a specific margin, using:

It would be great if the recent reduction in washing powder needed to get your wash perfectly

clean had resulted in an equal reduction of time needed to advertise this kind of products.

\inleft[.1.][ref]{.2.}
.1. + - low

.2. text

 $\inright[.1.][ref]{.2.}$

.1. + - low .2. *text*

There is also:

```
\inothermargin[.1.][ref]{.2.}
.1. +-low
.2. text
```

Some examples of the use of margin text appear below:

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67

\startlines
\inleft{to be}\quotation{To be or not to be} to me
\inright{or not}is rather famous english
\inmargin{to be}And just as it is meant to be
that quote will never perish
\stoplines

This will become:

to be "To be or not to be" to me is rather famous englishto be And just as it is meant to be that quote will never perish

or not

123 The mechanism of margin texts is rather complex. If you think of multiline margin texts and the alignment of these lines with the lines in the textbody you can imagine a few typographic problems. The number 123 next to this paragraph is not aligned but is typeset somewhat lower. This is done by adding the keyword low:

\inmargin[low]{\ssd 123}The mechanism of margin texts ...

It is possible to set up the way margin texts are typeset by means of the command:

\setupinmargin[][,=,]			
	left right number		
location	left right <u>both</u>		
style	normal bold slanted boldslanted type cap small command		
before	command		
after	command		
align	<u>inner</u> outer left right middle normal no yes		
line	number		
distance	dimension		
separator	text		
=	see p 257: \setupframed		

a rather marginal effect With align we define the left or right alignment of the margin text. Default margin texts are right aligned. In this example alignment is middle.

We can also align on the left of right side automatically. In a double sided document design optimisation of the margin text may ask for more than one processing step. In the example below you see some of the possible setups.

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67

75

left	This is left aligned
middle	but this goes in the middle. Don't forget that
right	right in this sense, align means a ragged right margin.
yes	Just to be complete, there is yes
10	and no.
inner	The outsiders inner and
outer	outer adapt themselvs to a doublesided design.
	The left and right margin can be set up separately by adding [left] or [right] as the first argument.
that way we can move quite some text into the margin	With before and after we can influence margin texts. Bij default the same line spacing is used as in the textbody. But when a narrower fontsize is used we can also adapt the interline spacing. For example:
	\setupinmargin [style=\bfx\setupinterlinespace]
	Page breaking and margin text are in conflict with each other. The reason is that T_EX first typesets a complete page in order to be able to determine the right spot for page breaking. However the margin text is already typeset at that moment. In a next processing stage the margin texts are typeset correctly. If you want to force margin texts in a margin you can type $\inmargin[+]$.
	The next command can be compared with the command like \section . Before the command is placed in the margin T _E X looks if it can be placed on the actual page. If not, it is moved to the following page.

<pre>\margintext[.1.][ref]{.2.}</pre>			
.1.	+ - low		
.2.	text		

The layout of your ASCII-file will not interfere with the function of this command. This may seem obvious, but T_EX programmers know that it is not the case. For example even commands that take care of index entries can be typed close to the margin texts.

The layout of your ASCII-file will not interfere with the function of this command. You might not expect it to, but T_EX programmers know that with T_EX , the layout of the source usually interferes with for instance margin texts and index entries. In CONTEXT commands that take care of margin texts take care of this situation, so that index entries can be typed close to the

4.20 Makeup

4.19 Aligned boxes

77

\lohi[.1.]{.2.}{.3.}

.1. low

.2. text

.3. text

The next example illustrates the use of these commands:

You can walk on \high {high} heels or \low {low} heels but your height is still the same.

This results in:

You can walk on ^{high} heels or _{low} heels but your height is still the same.

These commands relate to the ^ and _ in math mode. In case of larger fontsizes like \tfc, the ^ and _ will not create the desired output. Compare the examples below:

test\high{test} test test\$^{\rm test}\$ test {\bf test\high{test} test test\$^{\bf test}\$ test} {\tfb test\high{test} test test\$^{\tfb test}\$ test}

This becomes:

test^{test} test test^{test} test test^{test} test test^{test} test test^{test} test test^{test} test

4.10 Columns

The T_FX programmer knows that it is not easy to put text in columns. Gratefully a CONT_FXT user is not bothered with the implementation of extensive macros.

You can typeset text in columns.	
Most commands can be used in a nor-	
mal way without any problems. The	
floating object like tables or figures	
are somewhat limited. This is caused	
by the fact that TEX has limited ca-	
pabilities for typesetting columns.]

For insiders: columns are produced with the primitives: \output and \vsplit.

The number of columns is unlimited, however TEXs memory can only handle upto about twenty to thirty or

fourty columns.

The nu settin separa

umber of columns and the type	
g of a vertical line as a column	
ator is set up by:	

62
62
63
65
67
71
72
72
76
77
80
84
86

they were important.

periments.

D.E. Knuth

This example makes it painfully obvious that spacing between lines is not on forehand equal. By default the line spacing in this document is big, which equals $.75 \times \lineheight$. Furthermore, the allowable stretch in line spacing makes vertical alignment practically impossible.

For this reason the default line spacing is equal to the lineskip and stretching is not allowed. When a switch in fontsize is desirable you should do so before starting the column mechanism. Font switches within columns will have a poor result. The next example shows a line spacing equal to the lineskip.

Thus, I came to the conclusion that the designer of a new system must not only be the implementer and first large-scale user; the designer should also write the first user manual.

The separation of any of these four components would have hurt T_EX significantly. If I had not participated fully in all these activities, literally hundreds of improvements would never have been made, because I would This effect is reached by the (default) setup:

\setupcolumns[blank={fixed,line}]

In section 3.4 typesetting on a grid is explained. This mechanism works quite well within columns.

[FX. is. not. an. easy. to. learn. typesetting. sys-
tem or program. The problem is that "know-
ing everything is possible" leads to "wanting
everything that is possible". However using

CONT _E XT or T _E X takes considerable learning
time. And it is not feasible to explain every
single detail in this manualTherefore
ing" is the answer.

This text shows that one can do some tricks with columns. The frame is created by:

\def\FramedColumn#1{\ruledhbox{\box#1}}

\setupcolumns[command=\FramedColumn]

A less senseless display is:

 $\def\FramedColumn#1\%$

{\hbox to \hsize

{\ifodd\currentcolumn\unbox\hss#1\else\unbox#1\hss\fi}}

This time the columns will look like:

 T_EX is not an easy to learn typesetting system or program. The problem is that "knowing everything is possible" leads to "wanting everything that is possible". However using

 $ConT_EXT$ or T_EX takes considerable learning time. And it is not feasible to explain every single detail in this manual. Therefore "doing" is the answer.

A column can be manipulated as a whole. For example to create a background:

\setupfootnotes

```
[location=columns,
background=color,
backgroundcolor=white]
```

\setuplayout [grid=yes]

This time the column will be typeset on a grid:

 T_EX is not an easy to learn typesetting system or program. The problem is that "knowing everything is possible" leads to "wanting everything that is possible". However using

 $CONT_EXT$ or T_EX takes considerable learning time. And it is not feasible to explain every single detail in this manual. Therefore "doing" is the answer.

4.11 Paragraphs in columns

In some cases you want to typeset a paragraph in columns. For example in a definition where you have a first column containing meaningful text and a second column containing meaningful text. In these cases you can use:

1.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
1.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
ł.7	Struts	72
1.8	Text in the margin	72
4.9	Subscript and	
	superscript	76
4.10	Columns	77
4.11	Paragraphs in columns	80
4.12	Tabulate	84
4.13	Alignment	86
1.14	New lines	88
4.15	New page	91
4.16	Pagenumbers	92
4.17	Headers and footers	94
4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

81

4

∖definepa	ragraphs[][,=,]
n rule height before after	name number on <u>off</u> fit dimension command command
inner distance tolerance align	<i>command dimension</i> verystrict strict <u>tolerant</u> verytolerant stretch left right middle

This command defines a column layout that is recalled by its name.

\startparagraph ... \stopparagraph

The layout can be set up by:

∖setuppar	agraphs[.1.] <i>[.2.]</i> [,=,]
.1.	name
.2.	number each
style	normal bold slanted boldslanted type cap small command
width	dimension
height	dimension
align	left right middle width <u>breedte</u>
tolerance	verystrict strict <u>tolerant</u> verytolerant stretch
distance	dimension
before	command
after	command
inner	command
command	command
rule	on <u>off</u>

The width of non-specified columns is determined automatically. Distance relates to horizontal white space in front of a column. The next column is specified by:

 \paragraph

We show a simple example of the use of paragraphs in columns.

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and	
	superscript	76
4.10	Columns	77
4.11	Paragraphs in columns	80
4.12	Tabulate	84
4.13	Alignment	86
4.14	New lines	88
4.15	New page	91
4.16	Pagenumbers	92
4.17	Headers and footers	94
4.18	Footnotes	99
4.19	Aligned boxes	103

We also could have used \ new	true Columns instead of Two Columns Compating this	is more	4.15	New page
We also could have used \next IwoColumns instead of \IwoColumns. Sometimes this is more			4.16	Pagenumbers
readable in your ASCII text. An alternative specification is:			4.17	Headers and footers
\TwoColumns first text \\ second text \\				Footnotes

You can add a command to the keywords bottom and top. These commands will be executed before or after the text. For example a column can be forced down by [top=\vfill].

This is the right place to show a more complex example. The use of paragraphs is preferred over the use of columns because the text is kept together. If we want to score an item on two dimensions we need three columns:

\defineparagraphs [CombinedItem] [n=3,rule=on] \setupparagraphs [CombinedItem] [2] [width=3em] \setupparagraphs [CombinedItem] [3] [width=7em]

The item itself is defined with \defineenumeration (see section ??):

search go back exit

4.19 Aligned boxes

4.20 Makeup

\defineenumeration [SomeItem] [location=left,text=,width=3em,before=,after=]		1		
The scoring is done on a scale that is typeset as an itemization (see section ??). look like this in ASCII:	An item might	+		
<pre>\startCombinedItem \startSomeItem The student is able to write a detailed planning for the design and construction of a water purification plant. \stopSomeItem \nextCombinedItem \startitemize[5,packed] \item yes \item no \stopitemize \nextCombinedItem \startitemize[5,packed] \item self study \item class room \item simulation \stopitemize \stopCombinedItem And will result in: 1 The student is able to write a detailed planning for the design</pre>	 self study class room simulation 	$\begin{array}{c} 4.1\\ 4.2\\ 4.3\\ 4.4\\ 4.5\\ \end{array}$ $\begin{array}{c} 4.6\\ 4.7\\ 4.8\\ 4.9\\ \end{array}$ $\begin{array}{c} 4.10\\ 4.11\\ 4.12\\ 4.13\\ 4.14\\ 4.15\\ 4.16\\ 4.17\\ \end{array}$	Introduction Paragraphs Line spacing Indentation Vertical spacing (whitespacing) Word spacing Struts Text in the margin Subscript and superscript Columns Paragraphs in columns Tabulate Alignment New lines New page Pagenumbers Headers and footers	62 63 65 67 71 72 72 72 76 77 80 84 88 91 92 94
When the scoring scales are identical over all items we can use macros:		4.18 4.19	Footnotes Aligned boxes	99 103
\def\firstscale% {\startitemize[5,packed] \item yes \item no \stopitemize}		4.20	Makeup	105

Paragraphs in columns

\item self study \item class room \item simulation

\def\secondscale%

\stopitemize}

{\startitemize[5,packed]

\startCombinedItem	1		
\startSomeItem			
The student is able to write a detailed planning for the			
design and construction of a water purification plant.			
\stopSomeItem			
\nextCombinedItem	+		
\firstscale	4.1	Introduction	62
\nextCombinedItem	4.2	Paragraphs	62
\secondscale	4.3	Line spacing	63
\stopCombinedItem	4.4	Indentation	65
Or even more sophisticated:	4.5	Vertical spacing	
		(whitespacing)	67
\det\startitem%	4.6	Word spacing	71
{\startComplifiedItem	4.7	Struts	72
\StartSomeitem}	4.8	Text in the margin	72
\def\stopItem%	4.9	Subscript and	
{\stopSomeItem		superscript	76
\nextCombinedItem \firstscale	4.10	Columns	77
\nextCombinedItem \secondscale	4.11	Paragraphs in column	s 80
\stopCombinedItem}	4.12	Tabulate	84
\startItem	4.13	Alignment	86
The student is able to write a detailed planning for the	4.14	New lines	88
design and construction of a water purification plant.	4.15	New page	91
\stopItem	4.16	Pagenumbers	92
A definition like the one above can be very surprising. The commands in such a definition can	4.17	Headers and footers	94
interfere and result in undesirable output. We think of \vtop's that align on the baseline and	4.18	Footnotes	99
\vbox s that align under the baseline. Another example with framed texts show that ConT _E XT	4.19	Aligned boxes	103
takes care of most of the problems.	4.20	Makeup	105

	left		middle		right	
--	------	--	--------	--	-------	--

Tabulate 4.12

In a later chapter we will go into detail on typesetting tables. Consider this paragraph to be

search	go b	ack	exit
M	•		M

an appetizer. We use the term tabulate when a table is part of the running text. A simple tabulation looks like this:

\starttabulate[|l|p|]

 $\NC question \NC Sometimes it is surprising to notice that writers, independently of each other, explore the same theme along similar lines. Three of the four books mentioned here fall into this category. Which books do not belong in this list?$ $\NC \NR \stoptabulate$

\starttabulate[|1|1|1]

\NC A	. \NC	This Perfect Day	\NC Ira Levin	NC NR
\NC B	. \NC	Opstaan op Zaterdag	\NC Jan Gerhart Toonder	$\NC \NR$
\NC C	. \NC	Tot waar zal ik je brengen	\NC Anton Koolhaas	$\NC \NR$
\NC D	. \NC	The City And The Stars	\NC Arthur Clarke	$\NC \NR$
\stop	tabula	ate		

This results in:

question Sometimes it is surprising to notice that writers, independently of each other, explore the same theme along similar lines. Three of the four books mentioned here fall into this category. Which books do not belong in this list?

А.	This Perfect Day	Ira Levin
B.	Opstaan op Zaterdag	Jan Gerhart Toonder
C.	Tot waar zal ik je brengen	Anton Koolhaas

D. The City And The Stars Arthur Clarke

With NC we go to the next column and with NR to the next row. Definitions like [|1|p|] and [|1|1|1|] are called a template. The set ups are similar to those of starttable (see in ??).

The default template looks like this: [|1|p|]. The second column is typeset as a normal paragraph and with a width that is calculated automatically by $T_{E}X$.

\starttabulate
\NC d: \NC avond, afond, avend, afend \NC \NR
\NC t: \NC avont, afont, avent, afent \NC \NR
\stoptabulate

This quotation from "Spellingsverandering van zin naar onzin" by G.C. Molewijk (1992) will look like this:⁴

4.1	Introduction	62

Tabulate

86

- d: avond, afond, avend, afend
- t: avont, afont, avent, afent

4.13 Alignment

Horizontal and vertical alignment is set up by:

\setupalign[...]

... width left right middle inner outer wide broad height bottom line reset hanging nothanging hyphenated nothyphenated

The keys left, middle and right, inner and outer apply to horizontal alignment and bottom, height and line to vertical alignment.

The key right results in the text being typeset ragged right. The keyword broad can be combined with left, middle and right which results in somewhat more rough alignments.

The option line lets the last line touch the bottom of the page while height aligns the baseline to the bottom.

Individual lines can be aligned with the commands:

 $\label{eq:leftaligned} \$

... text

 $\mbox{midaligned}{\ldots}$

... text

 $\rightaligned{...}$

... text

alignment over a number of lines is done by:

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and	
	superscript	76
4.10	Columns	77
4.11	Paragraphs in columns	80
4.12	Tabulate	84
4.13	Alignment	86
4.14	New lines	88
4.15	New page	91
4.16	Pagenumbers	92
4.17	Headers and footers	94
4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

⁴ For the non-dutch readers: this book "Change of spelling, from sense to nonsense" is one of the most humorous books on the developments in a language one can imagine. If you ever come to studying dutch, you should give this book a try.

87

\startalignment ... \stopalignment[...]

..=.. see p 86: \setupalign

The text below shows a number of examples of horizontal alignment.

The Brittish stubbornly stick to driving at the left side of the road.

This can be considered a form conservatism, or alternatively phrased: right-wing thinking.

However, a political drive–in–the–middle compromise would definitely lead to accidents.

We done this with:

```
\leftaligned{The Brittish stubbornly stick to}
```

```
\leftaligned{driving at the left side of the road.}
```

\blank[medium]

```
\rightaligned{This can be considered a form conservatism,}
```

\rightaligned{or alternatively phrased: right||wing thinking.}
\blank[medium]

```
\midaligned{However, a political drive||in||the||middle}
```

\midaligned{compromise would definitely lead to accidents.}

The last words of a paragraph can be placed on the right hand side by the command \wordright, so with:

\wordright{...}

When typesetting a paragraph, T_EX tries several alternatives and decides which one to choose based on a system, of penalties. Normally T_EX is very strict, but we can instruct T_EX to be a bit more tolerant. This means that, instead of letting problematic situations remain unsolved —i.e. let words that cannot be hyphenated stick into the margin— T_EX will add a bit more stretch and apply different penalties for successive hyphens.

Alignment can be set up by:

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and	
	superscript	76
4.10	Columns	77
4.11	Paragraphs in columns	80
4.12	Tabulate	84
4.13	Alignment	86
4.14	New lines	88
4.15	New page	91
4.16	Pagenumbers	92
4.17	Headers and footers	94
4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

content commands index macros

```
\setuptolerance[..,...]
```

... horizontal vertical stretch space <u>verystrict</u> strict tolerant verytolerant

By default we use [horizontal,verystrict] for horizontal alignment and [vertical,strict] for vertical alignment.⁵ A last resort is provided by the keyword stretch, which in unsolvable situations will stretch spaces, extending the ugliness even further.

In double sided typesetting, alignment can be coupled to the left or right pages.

```
\startalignment[inner]
```

\quotation {Out of nowhere} is a rather normal way of saying that it is not clear where something originates. It is typically a phrase that has no counterpart, in the sense that nobody would comprehend the remark \quotation {Into somewhere}.

\stopalignment

\startalignment[outer]

\quotation {Out of bounds} is a similar quote. There is no counterpart \quotation {In of bounds}. Both examples demonstrate that in(ner) and out(er) are not always counterparts.

\stopalignment

Results of the commands above depend on the location of the page (left of right). The commands lead to:

"Out of nowhere" is a rather normal way of saying that it is not clear where something originates. It is typically a phrase that has no counterpart, in the sense that nobody would comprehend the remark "Into somewhere".

"Out of bounds" is a similar quote. There is no counterpart "In of bounds". Both examples demonstrate that in(ner) and out(er) are not always counterparts.

4.14 New lines

A new line is forced by:⁶

 $^{^{6}}$ In titles, headers and margin texts $\backslash \backslash$ is available for introducing a new line.

New	lines
-----	-------

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and	
	superscript	76
4.10	Columns	77
4.11	Paragraphs in columns	80
4.12	Tabulate	84
4.13	Alignment	86
4.14	New lines	88
4.15	New page	91
4.16	Pagenumbers	92
4.17	Headers and footers	94
4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

⁵ If you want a real ugly result, you should set the T_{EX} variable \pretolerance to 10.000. It is up to you.

89

\crlf

If you want to have lines show up the way you typed them in your source file you can use:

```
\startlines ... \stoplines
```

Default indenting is off. You can set up lines by:

```
\setuplines[..,..=..,..]
```

beforecommandaftercommandinbetweencommandindentingyes no even odd

If we set up indenting=odd for example we will obtain:

Come on, he said, give me a while,

and I will typeset you this text

with rivers like the river Nile

This was typed in the source file as:

\setupindenting[medium]

\setuplines[indenting=even]

\startlines

Come on, he said, give me a while, and I will typeset you this text with rivers like the river Nile \stoplines

Lines can be numbered with:

\startlinenumbering[...] ... \stoplinenumbering

... continue

A simple example of numbered lines might look like this:

\startlinenumbering

There is of course no problem with trying to prevent illegal copying of

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and	
	superscript	76
4.10	Columns	77
4.11	Paragraphs in columns	80
4.12	Tabulate	84
4.13	Alignment	86
4.14	New lines	88
4.15	New page	91
4.16	Pagenumbers	92
4.17	Headers and footers	94
4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

\cap {cd}'s and records. However, why should artists benefit from these measures, who themselves have no problems with copying themes, lyrics and melodies?

\stoplinenumbering

this becomes:

- 1 There is of course no problem with trying to prevent illegal copying of CD's and records.
- 2 However, why should artists benefit from these measures, who themselves have no problems
- 3 with copying themes, lyrics and melodies?

We can influence line numbering by:

\setuplinenumbering[,.=,.]		
conversion	numbers characters Characters romannumerals Romannumerals text	
start	number	
step	number	
width	dimension	
location	intext <u>inmargin</u>	
style	normal bold slanted boldslanted type cap small command	
prefix	text	
referencing	<u>on</u> off	

With the variable conversion you set up the type of numbering. You may even use your own character, for example an em-dash (keyed in as ---). In that case this character is set in front of each line.

In chapter 9.5 we will explain how we can refer to a linenumber. The parameters prefix and referencing can be used to unfluence that proces.

In the example below we use the following setup:

\setuplinenumbering[conversion=numbers,step=2,location=intext]

and:

\setuplinenumbering[conversion=characters,step=1,location=intext]

- a macro is a piece of text a but when fed to T_EX the program
- 2 random at first sight b you will be surprised
- a bunch of stupid tokens that4 looks less that awful right
- c thanks to macros your text tood will look quite organized

You can also mark lines in order to refer to specific line numbers. This will be shown in in chapter 9.5.

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and	
	superscript	76
4.10	Columns	77
4.11	Paragraphs in columns	80
4.12	Tabulate	84
4.13	Alignment	86
4.14	New lines	88
4.15	New page	91
4.16	Pagenumbers	92
4.17	Headers and footers	94
4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

4.15 New page

In some instances it is up to you to force, prevent or encourage a new page.

\page[..,...]

... <u>yes</u> makeup no preference bigpreference left right disable last quadruple even odd blank empty reset

The possible set ups are explained in table 4.3. If no setup is used \page will result in a new page.

setup	result
yes	force a new page
makeup	the same, without fill
no	when possible, avoid page break
preference	when possible, force page break
bigpreference	when possible, force page break, try harder
left	force a left page
right	force a right page
disable	ignore the next \page command
last	add last page(s)
quadruple	add pages until quadruple number of pages
even	go to the next even page
odd	go to the next odd page
blank	insert a completely blank page
empty	insert an empty page (with headers etc.)
reset	reset the disable command

Table 4.3Setups of \page.

The setups last and quadruple can be used in double sided (reduced) typesetting. The first setup up will add pages until an even number is obtained, the second set up will add pages until the next quadruple is reached. When you want to overrule the automatic page numbering you type the pagenumber yourself:

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and	
	superscript	76
4.10	Columns	77
4.11	Paragraphs in columns	80
4.12	Tabulate	84
4.13	Alignment	86
4.14	New lines	88
4.15	New page	91
4.16	Pagenumbers	92
4.17	Headers and footers	94
4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

\page[25]

You can also use a relative number like [+4]. You can use this feature when you want to be on the safe side and if you don't know at what page you are.

While generating empty pages you have to take doublesidedness into account, for example:

\page[right,empty,right]

4.16 Pagenumbers

At any location in the text the pagenumber can be set up with the command:

```
\setuppagenumber[..,.=..,.]
```

number number
state start stop keep

The pagenumber position on the page is defined by:

```
\setuppagenumbering[..,.=..,.]
```

alternative location conversion	<u>singlesided</u> doublesided header footer left right <u>middle</u> margin marginedge inleft inright <u>numbers</u> characters Characters romannumerals Romannumerals
style	normal bold slanted boldslanted type cap small command
left	text
right	text
way	bytext by <i>section</i> <u>bypart</u>
text	text
numberseparator	text
textseparator	text
sectionnumber	yes no
separator	text
strut	<u>yes</u> no
state	<u>start</u> stop
command	\command#1

The position varies with the nature of the document. With conversion we state the way we want to display the number. With location we define pagenumber positions like the bottom or top, left or right side or in the margin. You can use combinations of these options. For example:

\setuppagenumbering[location={header,inmargin}]

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and	
	superscript	76
4.10	Columns	77
4.11	Paragraphs in columns	80
4.12	Tabulate	84
4.13	Alignment	86
4.14	New lines	88
4.15	New page	91
4.16	Pagenumbers	92
4.17	Headers and footers	94
4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

alternative=singlesided	alternative=doublesided
left, right	marginedge
middle	middle
margin	margin

Table 4.4 setups to \setuppagenumbering.

Another alternative is {singlesided,doublesided}. In this case headers and footers will be mirrored in a double-sided document. The backspace is not mirrored (see figure 4.1).

1	r	1	r	1	r	r	1	l	r	r	1
1	r	1	r	1	r	r	1	1	r	r	1
	single	sided		singl	e,d	ouble			doubl	esided	

Figure 4.1 Three ways to mirror.

You can assign text to the parameters left and right. These texts will encloses the pagenum ber:

\setuppagenumbering[conversion=romannumerals,left={--~},right={~--}]

This will lead to: - viii -. With style you define the font and with state pagenumbering is switched on and off.

Numbering can become very fancy when you use **command** to execute an operation. This command has an argument and will be executed every time a pagenumber is placed. A framed pagenumber can be obtained by:

\setuppagenumbering[command=\inframed]

or partially framed by:

```
\def\mypagenumber#1%
```

{\inframed[frame=off,leftframe=on,rightframe=on]{#1}}

\setuppagenumbering[command=\mypagenumber]

In this we use \inframed instead of \framed, because the pagenumber must align with the texts of the headers and footers.

. These texts will encloses the pagenum-	
s,left={~},right={~}] font and with state pagenumbering is	
command to execute an operation. This

Pagenumbers

With textseparator you can define a separator between the section and pagenumber. Default this is a –. When the pagenumber is to appear at the margin the numberseparator is placed between the number and the footer text. Default this is a space with a width of 1em.

In interactive documents subpagenumbering is frequently used for hyperlinking. When every new section is started on a new page the footer text can be set up with:

\setupsubpagenumber

[way=byparagraph]
\setupfootertexts
[screen {\subpagenumber} of {\numberofsubpages}] []

The setup is done with:

```
\setupsubpagenumber[..,.=..,.]
```

way bytext by*section* <u>bypart</u> state start <u>stop</u> none

and the numbers themselves can be recalled by \subpagenumber and \numberofsubpages. These numbers are only reliable in headers and footers. In the case of interactive documents a more abstract definition can be used:

```
\setupfootertexts[][{\interactionbar[alternative=d]}]
```

In this case one can jump to the previous and following subpages. The subnumbering can be reset with [reset].

In a similar fashion one has access to the page number and the total number of pages: \pagenumber and \totalnumberofpages.

4.17 Headers and footers

Text in the header and footer are set up with the commands:

\setupheadertexts[.1.][.2.][.3.]

- .1. <u>text</u> margin edge
- .2. *text section* date *mark* pagenumber
- .3. *text section* date *mark* pagenumber

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and	
	superscript	76
4.10	Columns	77
4.11	Paragraphs in columns	80
4.12	Tabulate	84
4.13	Alignment	86
4.14	New lines	88
4.15	New page	91
4.16	Pagenumbers	92
4.17	Headers and footers	94
4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

\setupfootertexts[.1.][.2.][.3.]

- .1. <u>text</u> margin edge
- .2. *text section* date *mark* pagenumber
- .3. *text section* date *mark* pagenumber

A great number of arguments can be added. When the first argument is left out it is taken for granted that the footer and header should be place under or over the pagebody (text). The edge is located at the left side of the margin and is only used in interactive documents where a extended pagebody is needed.

The key date generates a date and pagenumber generates the pagenumber. Part, chapter and section titles can be summoned to appear in the header- and footer text by part, chapter, paragraph etc. By default the mark mechanism is active. Sectionnumbers can also be recalled: chapternumber etc.

Setting the **state** is done for the whole header, so one should use the one-argument version:

```
\setupheader[state=high]
```

Those who want more variations in headers and footers can use four instead of two arguments. Four arguments have only effect in double-sided documents.

\setupfootertexts
 [even left][even right]

```
[odd left][odd right]
```

So there are different combinations of arguments possible:

```
\setupheadertexts
```

\setuphead	ertexts	[mid	text]
------------	---------	------	-------

```
\setupheadertexts[left text][right text]
```

```
\setupheadertexts[left text][right text][left .][right .]
```

```
\setupheadertexts[location][left text][right text]
```

```
\setupheadertexts[location][left text][right text][left .][right .]
```

Instead of text, one can specify keywords like chapter, date or pagenumber. When the pagenumber is positioned in this way, one should also say:

```
\setuppagenumbering[location=]
```

The current setups of the headers and footers are cleared when no values are stated in \setupfootertexts. Problems can be expected when you use [] in your setup. These have to be enclosed in curly brackets:

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and	
	superscript	76
4.10	Columns	77
4.11	Paragraphs in columns	80
4.12	Tabulate	84
4.13	Alignment	86
4.14	New lines	88
4.15	New page	91
4.16	Pagenumbers	92
4.17	Headers and footers	94
4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

\setupfootertexts[chapter][{\currentdate[month,year]}]

The type setting of head- and foot texts can be influenced by:

$\setupheader[][,.=,.]$			
	<u>text</u> margin edge		
state	normal stop start empty high none nomarking name		
strut	<u>yes</u> no		
style	normal bold slanted boldslanted type cap small command		
leftstyle	normal bold slanted boldslanted type cap small command		
rightstyle	normal bold slanted boldslanted type cap small command		
leftwidth	dimension		
rightwidth	dimension		
before	command		
after	command		

and

```
\setupfooter[...][..,.=..,.]
```

... see p 96: \setupheader

..=.. see p 96: \setupheader

As with \setup...texts the first argument is optional. The keys state, before and after work on all parts of the pagebody, on the main text, the margins and edges.

When ...width is set up the text is clipped at the given width. The key strut is important when footers or headers contain other objects than text. When strut is set to no, the object is not corrected for linedepth. You could use the command \showstruts to get some information on this phenomena.

The setups with state are explained in table 4.5. You should bear in mind that page numbering will always continue whether or not the pagenumbers are placed.

When setups are done between start and stop they will only work locally. This means that the setups are reset after stop. Headers and footers may appear even while you think new ones should appear. This is due to the way T_EX determines valid breakpoints. One can never be certain when such an automatic break will occur. The solution is to force a new page by page before stop.

Headers and footers can be switched off on a page by means of:

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65

 \dots see p 96: \setupheader

\notopandbottomlines

When the height of an area equals zero, no text is placed. By default the top and bottom area have zero height, so setting their text areas without setting the height has no effect.

At the instance of a new part or chapter we can deal in a different way with the headers and footers. Suppose that a default setup looks like this:

```
\setupheadertexts[pagenumber]
```

\setupfootertexts[chapter][paragraph]

At the first page of new chapters this may look not too good. Therefore we could state:

\setuphead[chapter][header=empty,footer=empty]

However if we use it in this way we loose the pagenumber. A more adequate solution is:

```
\definetext[chapter][footer][pagenumber]
```

with:

\setuphead[chapter][header=high,footer=chapter,page=right]

we obtain the desired effect. The pagenumber appears in the foot and the header disappears completely. These kind of commands are essential when you don't want to define all kinds of setups locally in a text, for example before every new chapter. This mechanism only works when going to a new page enabled.

- .4. text
- .5. text

4.18 Footnotes

In some texts you can't do without footnotes. The footnote marker is placed in the text and the note itself is typeset at another location in the text, usually at the bottom of the page. Most often at the bottom of the page.

\footnote[*ref*]{...}

A footnote number or –symbol is recalled with:

 $\note[ref]$

An example of footnotes is given below.

The first compositions of the American composer Steve Reich will probably only appreciated by the most \quote {purist} among those who like minimal||music \footnote {A decent minimal is not so much characterized by a minimal use of musical instruments, but more by subtle shifts in polyphonic rhythms.}, his later works, like \quote {The Desert Music}, are compositions for full orchestra, where the orchestra is extended with a for Reich characteristic rhythm section \footnote {In most cases this section consists of pianos, marimbas and xylophones.} and choir. Together with John Adams, \footnote {His \quote {Fearful Symmetries} is a perfect mix of classic, jazz, swing and pop music.} Reich can be considered one of today's leading composers. It is, however, a pity that they can only be seen \footnote {The nice thing about compositions like \quote {Drumming} and \quote {Sextet} is de fact that \quotation {what the ear hears} differs

from what the \quotation {eye sees happening}.} and heard at the smaller broad companies, like the \cap {VPRO}. \footnote{A non commercial Dutch broadcast company.} \footnote {Sometimes also at other companies, because somehow this kind of music is quite suited for impressive and |/|or melodramatic documentaries.}

Undesired spaces are ignored. Spacing between two footnote numbers or symbols is taken care of. The result looks like this:

The first compositions of the American composer Steve Reich will probably only appreciated by the most 'purist' among those who like minimal–music⁷, his later works, like 'The Desert Music', are compositions for full orchestra, where the orchestra is extended with a for Reich characteristic rhythm section⁸ and choir. Together with John Adams,⁹ Reich can be considered one of today's leading composers. It is, however, a pity that they can only be seen¹⁰ and heard at the smaller broad companies, like the VPRO.^{11 12}

The type setting of the footnote can be setup with the command below that is defined in the setup area of your document.

content commands index macros

margindistance	dimension			
n	number			
numbercommand	\command#1			
split	tolerant strict verystrict <i>number</i>			
=	seep 252: \framed			

By default footnotes are placed at the bottom of a page. When using columns you can set location to columns so that the footnotes appear in the last column.

We can frame footnotes, place them in columns and decouple them from a page. The meaning of this last option is explained in an example.

```
\startlocalfootnotes[n=0]
 \placetable
 {A (latin) table.}
 \placelegend
 {\starttable[|1|r|]
    \HL
    \VL Nota \footnote {Bene} \VL Bene \footnote {Nota} \VL\FR
    \VL Bene \footnote {Nota} \VL Nota \footnote {Bene} \VL\LR
    \HL
    \stoptable}
    {\placelocalfootnotes}
```

The table enables the float placement mechanism, so we don't know on which page the table nor the footnotes will appear. So the footnotes are coupled to the table by using local footnotes.

4.1	Introduction	62

Footnotes

Table 4.6A (latin) table.

 $\verb|startlocalfootnotes ... \verb|stoplocalfootnotes||$

..=.. see p 101: \setupfootnotes

```
\placelocalfootnotes[..,.=..,.]
```

..=.. see p 101: \setupfootnotes

Footnotes can be placed at the end of a chapter or a document. The key location is set at text and we use the following command to place the footnotes:

```
\placefootnotes[...,.=...]
..=.. see p 101: \setupfootnotes
```

When n is set at 2, you can display the footnotes in columns. This should be done at an early stage because $T_{E}X$ is using the dimensions of the footnotes to determine the page break. More information can be found in the source code of the ConT_EXT module: core-not.tex.

The next example demonstrates that footnote numbers can be replaced by footnote symbols. In this example conversion is set at set 3.

```
note: use footnotes sparingly*
note: be brief**
note: no notes are even better* * *
```

Default the key number command is set \high, but other setups are allowed. You can also work with:

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67

4.20	Makeup	105

^{*} During the development of CONTEXT the footnote mechanism was one of the first real challenges. And I'm challenged still since I just encountered documents with footnotes within footnotes.

^{**} Why? See note*.

^{* * *} QED.

103

..=.. see p 219: \definedescription

to define the exact way of how to display the footnotes, because the standard definition mechanism is used (see section ??).

4.19 Aligned boxes

 T_EX is basically aware of two kind of boxes: \hbox and \vbox. A horizontal \hbox can be considered a line, a \vbox a paragraph. There are two types of vertical boxes: a \vbox aligns on the baseline of the last line, while a \vtop aligns on the first line.

\hbox{\hbox{one} \vbox{two\par three} \vtop{four\par five}}

When we make the frames visible —in this case we said \showboxes in advance— the example above becomes:

four	
fixo	
	four

In addition $ConT_EXT$ provides a lot of alternative boxes, like: \cbox, \lbox and \rbox. These commands can be used while defining your own macros, but will seldom appear in the running text. Like in \hbox and \vbox the dimension of the width can be added.

\cbox{... text ...}
\lbox to 4cm{... text ...}

The reader is invited to experiment with these commands. A new line is forced with $\backslash \backslash$.

For some very dedicated purposes there is \sbox. This command is used to give a box the height of a strut. You may forget this command.

To another category of boxes belong \tbox and \bbox. Both are used within tables. Look at the example below that illustrates their use.

4.1	Introduction	62
4.2	Paragraphs	62
4.3	Line spacing	63
4.4	Indentation	65
4.5	Vertical spacing	
	(whitespacing)	67
4.6	Word spacing	71
4.7	Struts	72
4.8	Text in the margin	72
4.9	Subscript and	
	superscript	76
4.10	Columns	77
4.11	Paragraphs in columns	80
4.12	Tabulate	84
4.13	Alignment	86
4.14	New lines	88
4.15	New page	91
4.16	Pagenumbers	92
4.17	Headers and footers	94
4.18	Footnotes	99
4.19	Aligned boxes	103
4.20	Makeup	105

The \tbox and \bbox are also used in figures.

\hbox	\vbox	\sbox	\tbox	\bbox

In $ConT_EXT$ a complete repertoire of macros is available that relies on boxes. For example we can add cutmarks to a box:

```
\setbox0=\vbox{The Final Cut\par --- \em Pink Floyd}
\makecutbox0 \box0
```

Be aware of the fact that such marks lie outside the boxes.

The Final Cut

We can visualize boxes by using \ruledhbox , \ruledvbox and \ruledvtop instead of \hox , \vbox and \vtop . With \showmakeup we can visualise everything automatically and we can get some insight on the features of $CONT_EXT$ and T_EX .

The next example shows that we can use T_EX for more than only the straight forward typesetting. However, to be able to do this, one should have some insight in the manipulation of boxes. We use buffers to enhance comprehensibility.

```
\startbuffer[water]
```

Drink geen water \crlf direct uit de kraan! \blank

\start

\tfx \setupinterlinespace Het drinkwater is tijdelijk niet betrouwbaar.
Kook het water voor consumptie ten minste 2[~]minuten. Zodra het water

```
weer betrouwbaar is, krijgt u bericht. \par
```

\stop

```

```

```
\hskip1em\box2\hskip1em\box0\hskip1em}
```

The result —an example of a drinking water warning— is shown below.

4.20 Makeup

A document may have a titlepage, a colofon and some pages that are not directly related to the main part of the document. Mostly these pages are not numbered and can do without headers and footers. Because their layout needs extra attention we prefer the word makeup for defining their specific layout.

The commands \startstandardmakeup and \stopstandardmakeup exclude text from the standard pagebody and its layout. Below a simple example is given. You will notice commands like \vfill, \blank, \tf and even \crlf and \vskip.

\tfd Jobs around the house \blank[2*big]

\tfb Part 1: Gas, water and electricity vfill

\tfb J. Hagen \crlf A.F. Otten \blank

```
\tfb Hasselt \crlf \currentdate[month,year]
```

```
\stopstandardmakeup
```

In double-sided documents an empty page is generated that functions as the backside of the title page. However sometimes this backside should also be typeset.

```
\startstandardmakeup[doublesided=no]
```

... the front

\stopstandardmakeup

```
\startstandardmakeup[page=no]
```

... the back

 \stopstandardmakeup

Because double-sided typesetting is turned off, a backside page is not generated. And because the key **page** is **no** the next page does not get the layout of a right hand side page (this would be default).

With the command **\showframe** frames can be made visible (temporarily) around the made up text. This is very convenient during the typesetting of separate pages.

Next to the command \startstandardmakeup one can define his own layout with different dimensions by means of:

```
\definemakeup[...][..,..=..,..]
... name
..=.. see p 107: \setupmakeup
```

5.1 Introduction

Through the millennia we have developed and adapted methods for storing facts and thoughts on a variety of different medium. A very efficient way of doing this is using logograms, like Chinese have done for ages. Another method is to represent each syllable in a word by a symbol, like the Japanese do when writing telegrams. However, the most familiar way of storing information is using a limited set of pictures representing so called phonemes. Such a collection is called an alphabet, and often the same glyph is used for different sounds.

Although T_EX is primarily meant for typesetting languages that use this third method, in principle the other two can also be dealt with. In this manual we will focus on the languages that use such alphabets.

The little pictures representing the characters that make up an alphabet are more or less standardized, and thereby can be recognized by readers, even if their details differ. Such a collection of pictures, often called glyphs, make up a font.

gap gap gap gap

From left to right we see the Computer Modern, a Lucida Bright, a Times Roman and an Antiqua Torunka font, all scaled to 60pt. Fonts colections are designed in such a way that the overall appearance of a page looks good and that reading is as comfortable as possible.

Within a font design there can be variations. In the example above we see a normal, a bold, an italic, and a bold italic alternative of the Lucida Bright font.

The distance between the individual glyphs in a word depend on the combinations of these glyphs. In the next sample, the gap between the b and the o as well as the distance between the o and the x is slightly altered. This is called kerning.

Here we show a Computer Modern, the default T_EX font. This font is designed by Donald Knuth and is a variation on a Monotype Times font. The Computer Modern has many kerning pairs, while the Lucida Bright used in this manual has none.

This kind of micro-typography is not to be altered by the user. It is part of the font design. However the user can alter fonts and interline spacing and some more aspects on the level of macro-typography. The choice of font is the main topic of this chapter.

There are different ways to classify fonts. There are classification systems based on times of development, the characteristics of the fonts or the font application, for example in a newspaper or a book.

ok ok ok ok ok

In this example we see five font styles of Lucida: the Bright, Sans, Typewriter, Handwriting and Calligraphy. This is one of the few examples of a font collection that provides many consistent alternative styles. The Computer Modern is another example of a rather complete font. It is one of the few fonts that comes with dedicated design sizes. The example below shows the differences of a 5, 7, 9, 12 and 17 point design scaled up to 48 points. Such nuances in font size are seldom seen these days.

Introduction

The general appearance of a style can be classified according to many schemes. In table 5.1 we see some examples of the naming of styles.

 Table 5.1
 Some ways of classifying the
 styles in a font.

The first two series are used by typographers, however in CONT_FXT we rather use the last series because it is traditionally used in plain T_FX. The command \rm is used to switch to a roman/ serif/regular style, and \tt for switching to mono spaced or typewriter style.

In the next sections we will go into switching of font styles and fonts in your documents. Note that the font switching mechanism is rather complex. This is caused by the different modes like math mode and text mode in CONT_FXT. If you want to be able to understand the mechanism you will have to acquaint yourself with the concept of the encoding vector and obtain some knowledge on fonts and their peculiarities.

5.2 The mechanism

Font switching is one of the eldest features of CONT_EXT because font switching is indispensable in a macropackage. The last few years extensions to the font switching mechanism were inevitable. We have chosen the following starting points during the development of this mechanism:

- To change a *style* must be easy, this means switching to: roman (serif, regular), sans serif (support), teletype (or monospaced) etc. (\rm, \ss, \tt etc.)
- More than one *variations* of character must be available like slanted and bold (\s1 and \bf).
- Different font *families* like Computer Modern Roman and Lucida Bright must be supported.
- Changing the bodyfont must also be easy, and so font size between 8pt and 12pt must be available by default.

м	•	M

- Within a font different sub- and superscripts must be available. The script sizes can be used during switching of family, style and alternative.
- Specific characteristics of a *body font* like font definition (encoding vector) must be taken into account.

Text can be typeset in different font sizes. We often use the unit pt to specify the size. The availability of these font sizes are defined in definition files. Traditionally font designers used to design a glyph collection for each font size, but nowadays most fonts have a design size of 10 points. An exception to this rule is the Computer Modern Roman that comes with most T_{EX} distributions.

The most frequently used font sizes are predefined: 8, 9, 10, 11, 12 and 14.4 points. When you use another size —for example for a titlepage— $ConT_EXT$ will define this font itself within the constraints of the used typeface. $ConT_EXT$ works with a precision of 1 digit which prevents unnecessary loading of fontsizes with small size differences. When a fontsize is not available $ConT_EXT$ prefers to use a somewhat smaller font size. We consider this to be more tolerable than a somewhat bigger font size.

The bodyfont (main font), font style and size is set up with:

```
\setupbodyfont[..,...]
```

... name <u>serif</u> regular roman sans support sansserif mono type teletype handwritten calligraphic 5pt ... <u>12pt</u>

In a running text a temporary font switch is done with the command:

```
\switchtobodyfont[..,...]
... 5pt ... 12pt small big global
```

This command doesn't change the bodyfont in headers and footers. With small and big you switch to a smaller or larger font.

In most cases, the command \setupbodyfont is only used once: in the styledefinition. Fontswitching is done with \switchtobodyfont. Don't mix these two up because this may lead to some rather strange but legitimate effects.

 T_EX searches for font information in the file with the extension tfm. Pre-loading is possible but ConTEXT will only load these files when necessarry. The reason is that filenames can differ per distribution.

The font used in headers, footers and footnotes are adapted automatically. This includes the interline space and vertical whitespaces. Font switches with \vi, \vii, \vii, \vii, \x, \x, and \xii have only local effects.

The commands:

{\xii	with these commands	\par}
{\xi	for font switching	par
{\x	it is possible to	par
{\ix	produce an eyetest:	par
{\viii	a x c e u i w m q p	\par}

When changing the size of the bodyfont, the interline space is adapted automatically. This is shown on the left. On the right we see what happens when the interline space is not adapted.

with these commands	with these commands
for font switching	for font switching
it is possible to	it is possible to
produce an eyetest:	produce an eyetest:
a x c e u i w m q p	a x c e u i w m q p

5.3 Font switching

The mechanism to switch from one style to another is rather complex and therefore hard to explain. To begin with, the terminology is a bit fuzzy. We call a collection of font shapes, like Lucida or Computer Modern Roman a family. Within such a family, the members can be grouped according to characteristics. Such a group is called a style. Examples of styles within a family are: roman, sans serif and teletype. We already saw that there can be alternative classifications, but they all refer to the pressence of serifs and the glyphs having equal widths. In some cases handwritten and/or calligraphic styles are also available. Within a style there can be alternatives, like **boldface** and *slanted*.

There are different ways to change into a new a style or alternative. You can use \ss to switch to a sans serif font style and \bf to get a bold alternative. When a different style is chosen, the alternatives adapt themselves to this style. Often we will typeset the document in one family and style. This is called the bodyfont.

A consequent use of commands like \bf and \sl in the text will automatically result in the desired bold and slanted altermatives when you change the family or style in the setup area

5.14	Figures	135

.

of your input file. A somewhat faster way of style switching is done by \ssbf, \sss1, etc. but this should be used with care, since far less housekeeping takes place.

The alternatives within a style are given below. The abbreviation s means *slanted*, itmeans *italic* and \bf means **boldface**. Sometimes \bs and \bi are also available, meaning **bold slanted** and **bold italic**. When an alternative is not known, CONT_FXT will choose a suitable replacement automatically.

With \os we tell CONT_EXT that we prefer mediaeval or old-style numbers 139 over 139. The \sc generates SMALL CAPS. With an x we switch to smaller font size, with a, b, c and d to a bigger one. The actual font style is stated by \tf or typeface.

\tfa \tfb \tfc \tfd \tfx \bfx \slx \itx \bf \sl \it \bs \bi \sc \os

It depends on the completeness of the font definition files whether alternatives like \bfa, \bfb, etc. are available. Not all fonts have for instance italic and slanted or both their bold alternatives. In such situations, slanted and italic are threated as equivalents.

Switching to a smaller font is accomplished by tfx, bfx, slx, etc., which adapt themselves to the actual alternative. An even more general downscaling is achieved by tx, which adapts itself to the style and alernative. This command is rather handy when one wants to write macros that act like a chameleon. Going one more step smaller, is possible too: \txx. Using tx when tx is already given, is equivalent to txx.

Frequent font switching leads to longer processing times. When no sub- or superscripts are used and you are very certain what font you want to use, you can perform fast font switches with: \rmsl, \ssbf, \tttf, etc.

Switching to another font style is done by:

When \mbox{rm} is chosen CONT_FXT will interpret the command \tfd as \mbox{rmd} . All default font setups use tf-setups and will adapt automatically.

The various commands will adapt themselves to the actual setup of font and size. For example:

{\rm test {\sl test} {\tfc test {\tx test} {\bf test}} {\ss test {\sl test \tx test} {\bf test \tx test}}

will result in:

index	macros

115

test test test test test test

test test test test test

When a character is not available the most acceptable alternative is chosen.

We will not go into the typographical sins of underlining. These commands are discussed in section 11.5 ("Underline").

5.4 **Characters**

A number of commands use the parameter style to set up the font style and size. You can use commands like s or rma or keywords like:

```
normal bold slanted boldslanted italic bolditalic type
small smallbold smallslanted ... smallitalic ... smalltype
capital
```

The parameter mechanism is rather flexible so with the parameter style you can type bold and \bf or bf. Even the most low level kind of font switching commands like 12ptrmbf are permitted. This is fast but requires some insight in macros behind this mechanism.

5.5 Available alternatives

There are only a few font families that can handle math. There is the Computer Modern Roman, the very beautiful Lucida Bright that we prefer in electronic documents, and of course one can use the 'prefered by publishers font' Times. These fonts carry a complete set of characters and symbols for mathematical typesetting. Among these, the Computer Modern Roman distinguishes itself by its many design sizes, which pays off when typesetting complicate math. On this design there are a few variations called Euler and Concrete.¹⁶

The Computer Modern Roman contains 70 charactertypes and sizes. Because a number of charactersizes are not defined the 11 point characters are defined as scaled 9 and 10 point characters under the option cmr. With eul and con we obtain a Computer Modern.

\showbodyfont[..,...]

Introduction

C

¹⁶ See Concrete Mathematics by Knuth cs., an outstanding book from the perspective of typography and didactically.

With the command \showbodyfont an overview is generated of the available characters. Below the 12pt-body font Computer Modern Roman (cmr) is shown. The close reader will note that not all alternatives are available by default.

	[cmr,12pt]									\mr	$\cdot: Ag$		
	\tf	\sc	\sl	\it	\bf	\bs	\bi	\tfx	\tfxx	\tfa	\tfb	\tfc	\tfd
\rm	Ag	AG	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag
\ss	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag
\tt	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag

We can see that the 12pt Lucida Bright (lbr) is somewhat bigger than the 12pt Computer Modern Roman. An x-character for example bfx is 2pts smaller than the actual typeface. The bigger characters are scaled by T_EX 's magstep.

	[lbr,12pt]						\mr	: Ag					
	∖tf	∖sc	\s1	\it	∖bf	∖bs	∖bi	\tfx	\tfxx	\tfa	\tfb	\tfc	\tfd
\rm	Ag	AG	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag
\ss	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag
\tt	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag	Ag

A last remark. When you have chosen a larger charactersize, for example tfb, then tf equals tfb, bf equals bfb, etc. This method is preferable over returning to the original character size.

5.6 Emphasize

Within most macropackages the command \mbox{em} is available. This command behaves like a chameleon which means that it will adapt to the actual typeface. In ConTEXT \mbox{em} has the following characteristics:

sear	ch	1	go b	ack	exit
M		•			 M

5.1	Introduction	109

- a switch to *slanted* or *italic* is possible
- a switch within \bf results in *bold slanted* or *bold italic* (when available)
- a so called *italic correction* is performed automatically (\/)

The bold italic or bold slanted characters are supported only when \bs and \bi are available.

The mnemonic {\em em} means {\em emphasis}. {\em The mnemonic {\em em} means {\em emphasis}.} {\bf The mnemonic {\em em} means {\em emphasis}.} {\em \bf The mnemonic {\em em} {\em emphasis}.} {\it The mnemonic em {\em means \bf emphasis}.} {\sl The mnemonic em {\em means \bf emphasis}.}

This results in:

The mnemonic em means emphasis.

The mnemonic em means emphasis.

The mnemonic em means emphasis.

The mnemonic em emphasis.

The mnemonic em means emphasis.

The mnemonic em means emphasis.

The advantage of the use of \em over \it and/or \sl is that consistent typesetting is enforced. By default emphasis is set at *slanted*, but in this text it is set at *italic*. The setting is made by: \setupbodyfontenvironment[default][em=italic]

5.7

Capitals

Words and abbreviations can be typeset in capitals. Both small and big characters are converted into capitals. When cap is used to typeset a capital the size is that of an tx. When we switch to slanted (sl), bold (bf), etc. the capital letter will also change. Since cap has a specific meaning in math mode, the format implementation is called kap. However in text mode one can use cap.

\kap{...} ... *text*

\Cap{...}
... text
\CAP{...}
... text
\Caps{.....}
... text

The first command converts all letters to a capital. We advise you not to type capital letters in your source file because real small caps distinguishes between small and big letters.

Capitals for \cap {UK} are \cap {OK} and capitals for \cap {USA} are okay. But what about capitals in \cap {Y2K}.

this results in:

Capitals for UK are OK and capitals for USA are okay. But what about capitals in Y2K.

A \kap within a \kap will not lead to any problems:

 $\label{eq:lagrange} $$ $$ explete that have gathered their \ explete that \ explete that \ explete that \ explete the exple$

or:

PEOPLE THAT HAVE GATHERED THEIR CAPITALCAPITAL AT THE COST OF OTHER PEOPLE ARE NOT SELDOM decapitated IN REVOLUTIONARY TIMES.

In this example we see that \cap can be temporarily revoked by \nocap .

\nocap{...}

The command \Cap changes the first character of a word into a capital and \CAP changes letters that are preceded by \\ into capital letters. With \Caps you can change the first character of several words into a capital letter.

```
\setupcapitals[..,.=..,.]
title yes no
sc yes no
```

With this command the capital mechanism can be set up. The key sc=yes switches to real SMALL CAPS. With title we determine whether capitals in titles are changed.

Next to the former **\cap-**commands we have:

\Word{...}

and

\Words{....}}

These commands switch the first characters of words into capitals. All characters in a word are changed with:

\WORD{...}

We end this section with real small capitals. When these are available the real small caps \sc are preferred over the pseudo-capital in abbreviations and logos.

In a manual on \TeX\ and Con\TeX t there is always the question whether to type $\lambda = \frac{TeX}$ and $\lambda = \frac{Con}{TeX t}$ or $\lambda = \frac{1}{2}$ and $\lambda = \frac$

Results in:

In a manual on T_EX and $ConT_EXt$ there is always the question whether to type T_EX and $CONT_EXT$ or T_EX and $CONT_EXT$. Both are defined as a logo in the style definition so we type \TEX and \CONTEXT, which come out as T_EX and $CONT_EXT$.

se

IT IS ALWAYS POSSIBLE TO TYPESET TEXT IN SMALL CAPITALS. HOWEVER, REALIZE THAT LOWER CASE CHARACTERS DISCRIMINATE MORE AND MAKE FOR AN EASIER READ.

An important difference between $\$ and $\$ is that the last command is used for a specific designed font type. The command $\$ on the other hand adapts itself to the actual typeface: *KAP*, *KAP*, *KAP*, *KAP*, etc.

Some typesetting packages stretch words (inter character spacing) to reach an acceptable alignment. In $CONT_EXT$ this not supported. On purpose! Words in titles can be stretched by:

```
\stretched{...}
... text
```

\hbox to \hsize {\stretched{there\\is\\much\\stretch\\in ...}}
\hbox to 20em {\stretched{... and\\here\\somewhat\\less}}

With \setminus we enforce a space ({} is also allowed).

there is much stretch in and here somewhat less

These typographically non permitted actions are only allowed in heads. The macros that take care of stretching do this by processing the text character by character.

5.8 Verbatim text

Text can be displayed in verbatim (typed) form. The text is typed between the commands:

\starttyping ... \stoptyping

Like in:

\starttyping

In this text there are enough examples of verbatim text. The command definitions and examples are typeset with the mentioned commands. Like in this example. \stoptyping

For in-line typed text the command \type is available.

arch	go back	exit

 $\type{...}$

... text

A complete file can be added to the text with the command:

\typefile{*.1.*}{.2.}

- .1. name
- .2. file

The style of typing is set with:

\setuptyp	\setuptyping[][,=,]				
	file typing name				
space	on <u>off</u>				
page	<u>yes</u> no				
option	slanted normal commands color <u>none</u>				
text	yes <u>no</u>				
icommand	command				
vcommand	command				
ccommand	command				
before	command				
after	command				
margin	dimension standard yes no				
evenmargin	dimension				
oddmargin	dimension				
blank	dimension small medium big standard halfline line				
escape	<u>/</u>				
indentnext	<u>yes</u> no				
style	normal bold slanted boldslanted type cap small command				
color	name				
palet	name <u>colorpretty</u>				
lines	<u>yes</u> no hyphenated				

This setup influences the display verbatim (\starttyping) and the verbatim typesetting of files (\typefile) and buffers (\typebuffer). The first optional argument can be used to define a specific verbatim environment.

\setuptyping[file][margin=default]

When the key **space=on**, the spaces are shown:

A very special case is:

\definetyping [broadtyping]

\setuptyping
[broadtyping]
[oddmargin=-1.5cm,evenmargin=-.75cm]

This can be used in:

startbroadtyping

A verbatim line can be very long and when we don't want to hyphenate we typeset it in the margin on the uneven pages. \stopbroadtyping

(scoppi dad cyping

At a left hand side page the verbatim text is set in the margin.

A verbatim line can be very long and when we don't want to hyphenate we typeset it in the margin on the uneven pages.

An in-line verbatim is set up by:

```
\setuptype[..,.=..,.]
space on off
option slanted normal none
style normal bold slanted boldslanted type cap small... command
color name
```

When the parameter option is set at slanted all text between << and >> is typeset in a *slant-ed letter*. This feature can be used with all parameters. In this way \type{aa<<bb>cc} will result in: aabbcc.

For reasons of readability you can also use other characters than { and } as *outer* parenthesis. You can choose your own non-active (a non-special) character, for example: \type+like this+ or \type-like that-. Furthermore you can use the mentioned << and >>, as in \type<ke this>> or even \type<like that>.

The parameter option=commands enables you to process commands in a typed text. In this option $\$ is replaced by /. This option is used for typesetting manuals like this one. For example:

```
\seethis <</rm : this command has no effect>>
```

```
/vdots
```

```
\sihtees <</sl : neither has this one>>
```

The double << and >> overtake the function of {}.

Within the type-commands we are using \tttf. When we would have used \tt, the \sl would have produced a slanted and \bf a bold typeletter. Now this will not happen:

\seethis : this command has no effect

\sihtees : neither has this one

One of the most interesting options of typesetting verbatim is a program source code. We will limit the information on this topic and refer readers to the documentation in the files verb-xxx.tex and cont-ver.tex. In that last file you can find the following lines:

\definetyping [MP] [option=MP] \definetyping [PL] [option=PL] \definetyping [JS] [option=JS] \definetyping [TEX] [option=TEX]

Here we see that it is possible to define your own verbatim environment. For that purpose we use the command:

```
\definetyping[...][...=..]
```

```
... file typing name
..=.. see p 121: \setuptyping
```

The definitions above couple such an environment to an option.

\startMP
beginfig (12) ;
 MyScale = 1.23 ;
 draw unitsquare scaled MyScale shifted (10,20) ;
endfig ;
\stopMP

In color (or reduced gray) this will come out as:

5.1	Introduction	109
5.2	The mechanism	111
5.3	Font switching	113
5.4	Characters	115
5.5	Available alternatives	115
5.6	Emphasize	116
5.7	Capitals	117
5.8	Verbatim text	120

5.13	Files	135
5.14	Figures	135

beginfig (12) ; MyScale = 1.23 ; draw unitsquare scaled MyScale shifted (10,20) ; endfig ;

These environments take care of typesetting the text in such a way that the typographics match the chosen language. It is possible to write several filters. Languages like METAPOST, METAFONT, PERL, JAVASCRIPT, SQL, and off course T_EX are supported. By default color is used to display these sources, where several palettes take care of the different commands. That is why you see the parameter palet in \setuptyping. One can use font changes or even own commands instead, by assigning the appropriate values to the icommand (for identifiers), vcommand (for variables) and ccommand parameters (for the rest). By default we have:

\setuptyping [icommand=\tts], vcommand=, ccommand=\tf]

We have some alternatives for \type. When typesetting text with this command the words are not hyphenated. Hyphenation is performed however when one uses:

\typ{...}

When you are thinking of producing a manual on $T_E X$ you have two commands that may serve you well:

 $\det{}$

... text

 $\arg{\ldots}$

... text

The first command places a \backslash in front of typed text and the second command encloses the text with .

5.9 Math

Many T_EX users have chosen T_EX for its superb math type setting. The math oriented character of T_EX has also influenced the font mechanism. We will not go into any details but the central

search	go back	exit
M	• •	H

key is the *family*. There is a font family for \bf, \it, etc. Within a family we distinguish three members: text, script and scriptscript, or a normal, smaller and smallest font. The normal font size is used for running text and the smaller ones for sub and superscripts. The next example will show what the members of a font family can do.

 $tf x^{2}+bf x^{2}+s1 x^{2}+bs x^{2}+bi x^{2} = m 6x^{2}$ $tf x^{2}+bf x^{2}+s1 x^{2}+bs x^{2}+bi x^{2} = tf 6x^{2}$ $tf x^{2}+bf x^{2}+s1 x^{2}+bs x^{2}+bi x^{2} = bf 6x^{2}$ $tf x^{2}+bf x^{2}+s1 x^{2}+bs x^{2}+bi x^{2} = bf 6x^{2}$

When this is typeset you see this:

 $x^{2} + x^{2} + x^{2} + x^{2} + x^{2} + x^{2} = 6x^{2}$ $x^{2} + x^{2} + x^{2} + x^{2} + x^{2} + x^{2} = 6x^{2}$ $x^{2} + x^{2} + x^{2} + x^{2} + x^{2} + x^{2} = 6x^{2}$ $x^{2} + x^{2} + x^{2} + x^{2} + x^{2} + x^{2} = 6x^{2}$

We can see that the characters adapt but that the symbols are typeset in the same font. Technically this means that the symbols are set in font family 0 (there are 16 families) and in this case that is default \tf.

It can also be done somewhat differently as we will see in the next example. A new command is used: \mbox{mf} , which stands for *math font*. This command takes care of the symbols in such a way that they are set in the actual font.¹⁷

 $x^{2} + x^{2} + x^{2} + x^{2} + x^{2} + x^{2} = 6x^{2}$ $x^{2} + x^{2} + x^{2} + x^{2} + x^{2} + x^{2} = 6x^{2}$ $x^{2} + x^{2} + x^{2} + x^{2} + x^{2} + x^{2} = 6x^{2}$ $x^{2} + x^{2} + x^{2} + x^{2} + x^{2} + x^{2} = 6x^{2}$ $x^{2} + x^{2} + x^{2} + x^{2} + x^{2} + x^{2} = 6x^{2}$ $x^{2} + x^{2} + x^{2} + x^{2} + x^{2} + x^{2} = 6x^{2}$ $x^{2} + x^{2} + x^{2} + x^{2} + x^{2} + x^{2} = 6x^{2}$

You should take into account that T_EX typesets a formula as a whole. In some cases this means that setups at the end of the formula have effect at the beginning.

 $\int x^2 + x^2 + x^2 + x^2 + x^2 + x^2 + x^2 = 6x^2$ $\int x^2 + x^2 + x^2 + x^2 + x^2 + x^2 = 6x^2$ $\int x^2 + x^2 + x^2 + x^2 + x^2 + x^2 = 6x^2$ $\int x^2 + x^2 + x^2 + x^2 + x^2 + x^2 = 6x^2$

¹⁷ We also see a strange visual effect. It seems as if the lines are sloped.

 $\int x^2 + x^2 + x^2 + x^2 + x^2 + x^2 = 6x^2$

\setupbodyfont

The example we used before would become:

 $x^2 + whatever + sin(2x)$

5.10 Em and Ex

In specifying dimensions we can distinguish physical units like pt and cm and internal units like em and ex. These last units are related to the actual fontsize. When you use these internal units in specifying for example horizontal and vertical spacing you don't have to do any recalculating when fonts are switched in the style definition.

5.1	Introduction	109
5.2	The mechanism	111
5.3	Font switching	113
5.4	Characters	115
5.5	Available alternatives	115

5.11	Definitions	127
5.12	Page texts	134
5.13	Files	135
5.14	Figures	135

Some insight in these units does not hurt. The width of an em is not the with of an M, but that of an — (an em-dash). When this glyph is not available in the font another value is used. Table 5.2 shows some examples. We see that the width of a digit is about .5em. In Computer Modern Roman a digit is excactly half an em wide.

\tf	∖bf	\s]	\tt	\ss	\tfx
12	12	12	12	12	12
M	M		M	M 	M
		İ-İ			

Table 5.2The width of an em.

In most cases we use em for specifying width and and ex for height. Table 5.3 shows some examples. We see that the height equals the height of a lowercase x.

\tf	∖bf	\s]	\tt	\ss	\tfx
≡x	≡x	$\equiv x$	≡x	≡×	≡x

5.11 Definitions

This section is meant for curious users or those users that want to do some experimenting on defining fonts. We will not discuss precise definitions of accents and encodings. For these issues we refer to the examples in the source code and the files font-xxx and enco-xxx.

Earlier we have seen that within a font family there are different font sizes. The relations between these sizes are defined with:

\definebodyfontenvironment

[12pt]		
Γ	text=12pt,	Math dimensions: normal dimensions
	script=9pt,	super- and subscripts and
scrip	tscript=7pt,	supersuper- and subsubscripts.
	x=10pt,	Pseudo caps and

M	•	

Definitions

xx=8pt,	nested pseudo caps.	
big=12pt,	In case we switch to	big
small=10pt]	or small.	

When we use a fontsize that is not predefined in this way $ConT_EXT$ applies the same proportions anyhow. You can alter this definition by specifying the parameter default. When you want to have a somewhat bigger fontsize you can type:

```
\definebodyfontenvironment [24pt]
```

You can switch to a 12.4 environment, without any specific actions. Within a group these fontdefinitions are temporary. When you use the definitions several times in your document you should type the definitions in the setup area of your source file (style definition) since this can save much runtime.

An overview of the different fontsizes within a family can be summoned with:

```
\showbodyfontenvironment[..,...]
```

```
... see p 112: \setupbodyfont
```

[lbr]							
text	script	scriptscript	x	xx	small	big	interlinie
20.7pt	14.4pt	12pt	17.3pt	14.4pt	17.3pt	20.7pt	
17.3pt	12pt	10pt	14.4pt	12pt	14.4pt	20.7pt	
14.4pt	11pt	9pt	12pt	10pt	12pt	17.3pt

5pt	5pt	5pt	5pt	5pt	5pt	7pt	
4pt	4pt	4pt	4pt	4pt	4pt	6pt	

For the lbr family of fonts this is:

	search	go l	back	exit
-	м	•		M

For all regular fontsizes environments are predefined that fulfill their purpose adequately. However when you want to do some extra defining yourself there is:

5.1	Introduction	109
5.2	The mechanism	111
5.3	Font switching	113
5.4	Characters	115
5.5	Available alternatives	115
5.6	Emphasize	116
5.7	Capitals	117
5.8	Verbatim text	120
5.9	Math	124
5.10	Em and Ex	126
5.11	Definitions	127
5.12	Page texts	134
5.13	Files	135
5.14	Figures	135

```
\setupbodyfontenvironment[...][..,.=..,.]
```

```
... see p 112: \setupbodyfont
```

```
..=.. see p 112: \setupbodyfont
```

The real definitions, i.e. the coupling of commands to the font files, can be done in different ways. The most transparant is the font file font-phv.

\definefontsynonym	[Sans]	[Helvetica]
\definefontsynonym	[SansBold]	[Helvetica-Bold]
\definefontsynonym	[SansItalic]	[Helvetica-Oblique]
\definefontsynonym	[SansSlanted]	[Helvetica-Oblique]
\definefontsynonym	[SansBoldItalic]	[Helvetica-BoldOblique]
\definefontsynonym	[SansBoldSlanted]	[Helvetica-BoldOblique]
\definefontsynonym	[SansCaps]	[Helvetica]

\definebodyfont [14.4pt,12pt,11pt,10pt,9pt,8pt,7pt,6pt,5pt] [ss] [default]

With \definefontsynonym we couple a logical name, like SansBold to a font name, like Helvetica-Bold. The real coupling is done somewhere else, by default in the file font-fil. There you will see:

```
\definefontsynonym [Helvetica-Bold] [hvb] [encoding=texnansi]
```

This is the only location where a system dependent setup is made. When we work under the naming regime of Karl Berry, the next setup would be more obvious (see font-ber):

\definefontsynonym [Helvetica-Bold] [phvb] [encoding=ec]

Coupling fonts in this way has no real limits. It is interesting to look in font-unk where different styles are coupled in such a way that they be used interchangeably.

```
\definefontsynonym [Regular] [Serif]
\definefontsynonym [Roman] [Serif]
```

We see that the basic specification is Serif. The default serif fonts are defined with:

```
\definebodyfont [default] [rm]
```

[tf=Serif	sa	1,	
tfa=Serif	sa	a,	
sl=SerifSlanted	sa	1,

5.1

sla=SerifSlanted sa a, ...1

We saw that \tf is the default font. Here \tf is defined as Serif sa 1 which means that it is a serif font, scaled to a normal font size. This Serif is projected elsewhere on for example LucidaBright which in turn is projected on the filename lbr.

The kind of all-in-one definitions as shown previously for Helvetica use the default settings and enable easy font definitions. This is okay for fonts that come in one design size.

We, like other T_FX users, started with the use of Computer Modern Roman fonts. Since these fonts have specific design sizes CONT_EXT supports accurate definitions. See the file font-cmr:

```
\definebodyfont [12pt] [rm]
  [ tf=cmr12,
   tfa=cmr12 scaled \magstep1,
   tfb=cmr12 scaled \magstep2,
  tfc=cmr12 scaled \magstep3,
  tfd=cmr12 scaled \magstep4,
    bf=cmbx12,
    it=cmti12,
    s]=cms]12,
    bi=cmbxti10 at 12pt,
    bs=cmbxs110 at 12pt,
    sc=cmcsc10 at 12pt]
```

We use here the available $T_{F}X$ -specifications scaled and at, but $ConT_{E}XT$ also supports a combination of both: sa (scaled at). For example if we do not want to use the default Helvetica definition we define:

```
\definebodyfont [12pt,11pt,10pt,9pt,8pt] [ss]
```

[tf=hv	sa	1.000,
bf=hvb	sa	1.000,
it=hvo	sa	1.000,
sl=hvo	sa	1.000,
tfa=hv	sa	1.200,
tfb=hv	sa	1.440,
tfc=hv	sa	1.728,
tfd=hv	sa	2.074,
sc=hv	sa	1.000]

5.1	Introduction	109
5.2	The mechanism	111
5.3	Font switching	113
5.4	Characters	115
5.5	Available alternatives	115
5.6	Emphasize	116
5.7	Capitals	117
5.8	Verbatim text	120
5.9	Math	124

5.11	Definitions	127
5.12	Page texts	134
5.13	Files	135
5.14	Figures	135

The scaling is done in relation to the bodyfont size. In analogy with T_EX 's \magstep we can use \magfactor: instead of sa 1.440 we specify sa \magfactor2. Because typing all these numbers is rather tiresome so we replace 1.200 by a, etc. The relations between a and 1.200 can be set up in the bodyfont environment.

\definebodyfont [12pt,11pt,10pt,9pt,8pt] [ss]

[tf=hv sa 1, tfa=hv sa a, tfb=hv sa b, tfc=hv sa c, tfd=hv sa d]

Since font files are used in all interfaces we use English commands. The definitions take place in files with the name font-xxx.tex, see for example the file font-cmr.tex.

```
\definebodyfont[...,1.,..][.2.][....=....]
.1.
       5pt ... 12pt default
.2.
       rm ss tt mm hw cg
tf
       file
bf
       file
s٦
       file
it
       file
       file
bs
       file
bi
       file
sc
       file
ex
mi
       file
       file
sy
       file
ma
       file
mb
       file
mс
```

The setups ex, mi, sy, ms, mb and mc relate to the math charactersets. The first three we can also find in plain T_EX , the last three are necessary in other font families. The symbols and characters in \mathcal{A}_MS - T_EX can also be used in CONT_EXT: \definebodyfont [ams]. These can be found in ma and mb.

The a-d are not mandatory. As an example we will define a bigger fontsize of \tf:

\definebodyfont [10pt,11pt,12pt] [rm] [tfe=Regular at 48pt]
\tfe Big Words.

This becomes:

This definition brings us to other definitions. It is possible to define a bodyfont in a several ways. We can use classifications like Regular, or abstract names like TimesRoman, or filenames, like tir, or even fancy names like HeadLetter.

```
\definebodyfont[HeadLetter][Regular sa 1.2]
```

After these definitions we can use \HeadLetter to switch fonts. It may be necessary to adapt the interline spacing with \setupinterlinespace like this:

```
\HeadLetter \setupinterlinespace text \par
```

For advanced T_FX users there is the dimension-register \bodyfontsize. This variable can be used to set fontwidths. The number (rounded) points is available in \bodyfontpoints.

Until now we assumed that an a will become an a during type setting. However, this is not always the case. Take for example ä or æ. This character is not available in every font and certainly not in the Computer Modern Typefaces. Often a combination of characters \"a or a command ae will be used to produce such a character. In some situation T_FX will combine characters automatically, like in fl that is combined to fl and not fl. Another problem occurs in converting small print to capital print and vice versa.

Below you see an example of the texnansi mapping:

\startmapping[texnansi]

\definecasemap	228	228	196	\definecasemap	196	228	196
\definecasemap	235	235	203	\definecasemap	203	235	203
\definecasemap	239	239	207	\definecasemap	207	239	207
\definecasemap	246	246	214	\definecasemap	214	246	214
\definecasemap	252	252	220	\definecasemap	220	252	220
\definecasemap	255	255	159	\definecasemap	159	255	159

\stopmapping

This means so much as: in case of a capital the character with code 228 becomes character 228 and in case of small print the character becomes character 196.

These definitions can be found in **enco-ans**. In this file we can also see:

\startencoding[texnansi] \defineaccent " a 228

As a result of the way accents are placed over characters we have to approach accented characters different from normal characters. There are two methods: TFX does the accenting itself or prebuild accentd glyphs are used. The definitions above take care of both methods. Other definitions are sometimes needed. In the documentation of the file enco-ini more information on this can be found.

We once again return to font definitions. Fast fontswitching is done with commands like \xii or \twelvepoint, which is comparable to the way it is done in plain T_FX. These commands are defined with:

\definefontsynonym [twelvepoint] [12pt] \definefontsynonym [xii] [12pt]

The keys in \setupbodyfont are defined in terms of:

- \definefontstyle [rm,roman,serif,regular] [rm]
- \definefontstyle [ss,sansserif,sans,support] [ss]
- \definefontstyle [tt,teletype,type,mono] [tt]
- \definefontstyle [hw,handwritten] [hw]
- \definefontstyle [cg,calligraphic] [cg]

In many command setups we encounter the parameter style. In those situations we can specify a key. These keys are defined with \definestyle. The third argument is only of importance in chapter and section titles, where, apart from \cap, we want to obey the font used there.

\definestyle	[boldslanted,slantedbold]	[\bs]	[]
\definestyle	[small,smallnormal]	[\tfx]	[]

In section 5.6 we have already explained how *emphasizing* is defined. With oldstyle digits this is somewhat different. We cannot on the forehand in what font these can be found. By default we have the setup:

\definefontsynonym [OldStyle] [MathItalic]

As we see they are obtained from the same font as the math italic characters.

In addition to these commands there are others, for example macros for manipulating accents. These commands are discussed in the file font-ini. More information can also be found in the file core-fnt and specific gimmicks in the file supp-fun. So enjoy yourself.

5.12 Page texts

Page texts are texts that are placed in the headers, footers, margins and edges of the so called pagebody. This sentence is for instance typeset in the bodyfont in the running text. The fonts of the page texts are set up by means of different commands. The values of the parameters may be something like style=bold but style=\ss\bf is also allowed. Setups like style=\ssbf are less obvious because commands like \kap will not behave the way you expect.

Switching to a new font style (\ss) will cost some time. Usually this is no problem but in interactive documents where we may use interactive menus with dozens of items and related font switches the effect can be considerable. In that case a more efficient font switching is:

```
\setuplayout[style=\ss]
```

Border texts are setup by its command and the related key. For example footers may be set up with the key letter:

\setupfooter[style=bold]

135

5.13 Files

A number of font definition files that are standard in most distributions are mentioned in table 5.4. These fonts can be recalled by their last three letters.

font-cmr	Computer Modern Roman
font-csr	Computer Slavik Roman (?)
font-con	Concrete Roman
font-eul	Euler
font-ams	American Mathematics Society
font-ant	Antykwa Torunska
font-lbr	Lucida Bright
font-pos	Base PostScript Fonts
font-ptm	Times Roman
font-phv	Helvetica
font-pcr	Courier
font-fil	Standard Filenames
font-ber	Karl Berry FileNames

Table 5.4Some standard font definition files(pos = ptm + phv + pcr).

The most commonly used encoding vectors, like **ans**, **ec** and **il2**, are preloaded. Extra encoding files are loaded by \useencoding, but this is seldom needed. The last two files mentioned in table 5.5 relate to the support of the non-standard keyboard styles. These should be loaded explicitly.

5.14 Figures

When you use figures in your document they may contain text. Most of time the T_EX -fonts are not available. When you use a serif in your document you can best use a Helvetica in the figures. In figure 5.1 we use a Helvetica, while we use Knuth's Sans Serif in the caption.

Color and background

6.1 Introduction

Judicious use of color can enhance your document's layout. For example. in interactive documents color can be used to indicate hyperlinks or other aspects that have no meaning in paper documents, or background colors can be used to indicate screen areas that are used for specific information components.

In this chapter we describe the $CONT_EXT$ color support. We will also pay attention to backgrounds and overlays because these are related to the color mechanism.

6.2 Color

One of the problems in typesetting color is that different colors may result in identical gray shades. We did some research in the past on this subject and we will describe the $CONT_EXT$ facilities on this matter and the way $CONT_EXT$ forces us to use color consistently. Color should not be used indiscriminately, therefore you first have to activate the color mechanism:

\setupcolors[state=start]

Other color parameters are also available:

```
      \setupcolors[...,.=..]

      state
      start stop global local

      conversion
      yes no always

      reduction
      yes no

      rgb
      yes no

      cmyk
      yes no

      mpcmyk
      yes no
```

The parameter state can also be set at local or global. If you do not know whether the use of color will cross a page boundary, then you should use global or start to keep track of the color. We use local in documents where color will never cross a page border, as is the case in many screen documents. This will also result in a higher processing speed. (For most documents it does not hurt that much when one simply uses start).

By default both the RGB and CMYK colorspaces are supported. When the parameter cmyk is set at no, then the CMYK color specifications are automatically converted to RGB. The reverse

6.1	Introduction	138
6.2	Color	138
6.3	Grayscales	142
6.4	Colorgroups and	
	palettes	142
6.5	Text backgrounds	147
6.6	Layout backgrounds	149
6.7	Overlays	150
6.8	METAPOST	152

is done when rgb=no. When no color is allowed the colors are automatically converted to weighted grayshades. You can set this conversion with conversion. When set to always, all colors are converted to gray, when set to yes, only gray colors are converted.

Colors must be defined. For some default color spaces, this is done in the file colo-xxx.tex. After definition the colors can be recalled with their mnemonic name xxx. By default the file colo-rgb.tex is loaded. In this file we find definitions like:

 $\label{eq:constraint} $$ $ definecolor [darkred] [r=.5, g=.0, b=.0] $$ definecolor [darkgreen] [r=.0, g=.5, b=.0] $$ $$

A file with color definitions is loaded with:

\setupcolor[rgb]

Be aware of the fact that there is also a command \setupcolors that has a different meaning. The rgb file is loaded by default.

Color must be activated like this:

\startcolor[darkgreen]

We can use as many colors as we like. But we do have to take into account that the reader is possibly \color [darkred] {colorblind}. The use of color in the running text should always be carefully considered. The reader easily tires while reading multi||color documents. \stopcolor

In the same way you can define CMYK colors and grayshades:

\definecolor [cyan] [c=1,m=0,y=0,k=0]

 $\ensuremath{\mathsf{definecolor}}\[gray]\[s=0.75]$

gray can also be defined like this:

\definecolor [gray] [r=0.75,r=0.75,b=0.75]

When the parameter conversion is set at yes the color definitions are automatically downgraded to the s-form: [s=.75]. The s stands for 'screen'. When reduction is yes, the black component of a CMYK color is distilled from the other components.

One of the facilities of color definition is the heritage mechanism:

\definecolor [important] [red]

6

These definitions enable you to use colors consistently. Furthermore it is possible to give all important issues a different color, and change colors afterwards or even in the middle of a document.

So, next to \setupcolors we have the following commands for defining colors:

\definecolor[][,=,]					
	name				
r	text				
g	text				
b	text				
с	text				
m	text				
у	text				
k	text				
s	text				

A color definition file is loaded with:

\setupcolor[...]

Typesetting color is done with:

\color[.1.]{.2.}

.1. text

\startcolor[...] ... \stopcolor

... name

... text

A complete palette of colors is generated with:

 $\showcolor[...]$

... name

Figure 6.1 shows the colors that are standard available (see colo-rgb.tex).

content commands index macros

Figure 6.1 Some examples of colors.

The use of color in T_EX is not trivial. T_EX itself has no color support. Currently color support is implemented using T_EX 's low level \mark's and \special's. This means that there are some limitations, but in most cases these go unnoticed.

It is possible to cross page boundaries with colors. The headers and footers and the floating figures or tables will stil be set in the correct colors. However, the mechanism is not robust.

In this sentence we use colors within colors. Aesthetically this is bad.

As soon as a color is defined it is also available as a command. So there is a command \darkred. These commands do obey grouping. So we can say {\darkred this is typeset in dark red}.

There are a number of commands that have the parameter color. In general, when a style can be set, color can also be set.

The default color setup is:

\setupcolors [conversion=yes, reduction=no, rgb=yes, cmyk=yes]

This means that both colorspaces are supported and that the k-component in CMYK colors is maintained. When reduction=yes, the k-component is 'reduced'. With conversion=no equal color components are converted to gray shades.

6.3 Grayscales

When we print a document on a black and white printer we observe that the differences between somes colors are gone. Figure 6.2 illustrates this effect.

0.300 0.850 1.000	0.400 0.800 1.000	0.500 0.750 1.000

Figure 6.2 Three cyan variations with equal gray shades.

In a black and white print all blocks look the same but the three upper blocks have different cyan based colors. The lower blocks simulate grayshades. We use the following conversion formula:

 $gray = .30 \times red + .59 \times green + .11 \times blue$

A color can be displayed in gray with the command:

\graycolor[...]

The actual values of a color can be recalled by the commands \colorvalue{name} and \grayvalue{name}.

We can automatically convert all used colors in weighted grayshades.

\setupcolors [conversion=always]

6.4 Colorgroups and palettes

 T_EX itself has hardly any built-in graphical features. However the CONTEXT color mechanism is designed by looking at the way colors in pictures are used. One of the problems is the effect we described in the last section. On a color printer the picure may look fine, but in black and white the results may be disappointing.

In T_EX we can approach this problem systematically. Therefore we designed a color mechanism that can be compared with that in graphical packages.

м	• •	

We differentiate between individual colors and colorgroups. A colorgroup contains a number of gradations of a color. By default the following colorgroups are defined.

The different gradations within a colorgroup are represented by a number. A colorgroup is defined with:

```
\definecolorgroup[.1.][.2.][x:y:z=,..]
```

- .1. name
- .2. <u>rgb</u> cmyk gray s

An example of a part of the RGB definition is:

\definecolorgroup
 [blue][rgb]
 [1.00:1.00:1.00,
 0.90:0.90:1.00,
,
 0.40:0.40:1.00,
 0.30:0.30:1.00]

The **[rgb]** is not mandatory in this case, because CONT_EXT expects RGB anyway. This command can be viewed as a range of color definitions.

\definecolor [blue:1] [r=1.00, g=1.00, b=1.00] \definecolor [blue:2] [r=0.90, g=0.90, b=1.00] \definecolor [blue:7] [r=0.40, g=0.40, b=1.00] \definecolor [blue:8] [r=0.30, g=0.30, b=1.00]

M	•	M

A color within a colorgroup can be recalled with *name:number*, for example: blue:4.

There is no maximum to the number of gradations within a colorgroup, but on the bases of some experiments we advise you to stay within 6 to 8 gradations. We can explain this. Next to colorgroups we have palettes. A pallet consists of a limited number of *logical* colors. Logical means that we indicate a color with a name. An example of a palette is:

	top	bottom	up	down	strange	charm
alfa						

The idea behind palettes is that we have to avoid colors that are indistinguishable in black and white print. A palette is defined by:

```
\definepalet
 [example]
 [strange=red:3,
    top=green:1,
    ....
 bottom=yellow:8]
```

We define a palette with the command:

```
\definepalet[...][..,.=..,.]
... name
name name
```

CONT_EXT contains a number of predefined palettes. Within a palette we use the somewhat abstract names of quarks: *top, bottom, up, down, strange* and *charm*. There is also *friend* and *rude* because we ran out of names. Be aware of the fact that these are just examples in the RGB definition file and based on our own experiments. Any name is permitted.

The system of colorgroups and palettes is based on the idea that we compose a palette from the elements of a colorgroup with different numbers. Therefore the prerequisite is that equal numbers should have an equal grayshade.

When a palette is composed we can use the command:

```
\setuppalet[...]
... name
```

6.2	Color	138

6.8	METAPOST	152

138

6.1 Introduction

sear	ch	go ł	oack	exit
M				 M

After that we can use the colors of the chosen palette. The logical name can be used in for example \color[strange]{is this not strange}.

An example of the use of palettes is shown in the verbatim typesetting of T_EX code. Within this mechanism colors with names like prettyone, prettytwo, etc. are used. There are two palettes, one for color and one for gray:

```
\definecolor [colorprettyone] [r=.9, g=.0, b=.0]
\definecolor [grayprettyone] [s=.3]
```

These palettes are combined into one with:

\definepalet

[colorpretty]

[prettyone=colorprettyone, prettytwo=colorprettytwo, prettythree=colorprettythree, prettyfour=colorprettyfour]

\definepalet

[graypretty]

prettyone=grayprettyone,	prettytwo=grayprettytwo,
prettythree=grayprettythree,	prettyfour=grayprettyfour]

Now we can change all colors by resetting the palette with:

```
\setuptyping[palet=colorpretty]
```

Each filter can be set differently:

```
\definepalet [MPcolorpretty] [colorpretty]
\definepalet [MPgraypretty] [graypretty]
```

6.1	Introduction	138
6.2	Color	138
6.3	Grayscales	142
6.4	Colorgroups and	
	palettes	142
6.5	Text backgrounds	147
6.6	Layout backgrounds	149
6.7	Overlays	150
6.8	METAPOST	152

As you can see a palette can inherit its properties from another palette. This example shows something of the color philosophy in $CONT_EXT$: you can treat colors as abstractions and group them into palettes and change these when necessary.

On behalf of the composition of colorgroups and palettes there are some commands available to test whether the colors are distinguishable.

```
\showcolorgroup[.1.][..,.2.,..]
.1.
       name
.2.
      horizontal vertical name value number
\showpalet[.1.][..,.2.,..]
.1.
       name
      horizontal vertical name value
.2.
comparecolorgroup[...]
       name
. . .
\comparepalet[...]
       name
. . .
```

6.1	Introduction	138
6.2	Color	138
6.3	Grayscales	142
6.4	Colorgroups and	
	palettes	142
6.5	Text backgrounds	147
6.6	Layout backgrounds	149
6.7	Overlays	150
6.8	METAPOST	152

The overviews we have shown thus far are generated by the first two commands and the gray values are placed below the baseline. On the left there are the colors of the grayshades.

search	go back	exit
M	• •	M

This overview is made with \comparecolorgroup[green] and the one below with \comparepalet[gamma].

The standard colorgroups and palettes are composed very carefully and used systematically for coloring pictures. These can be displayed adequately in color and black and white.

Figure 6.3 Some examples of the use of color.

6.5 Text backgrounds

In a number of commands, for example \framed, you can use backgrounds. A background may have a color or a screen (pure gray). By default the backgroundscreen is set at 0.95. Usable values lie between 0.70 and 1.00.

Building screens in T_EX is memory consuming and may cause error messages. The screens are therefore build up externally by means of POSTSCRIPT or PDF instructions. This is set up with:

```
\setupscreens[..,.=..,.]
method dot rule external
resolution number
factor number
screen number
```

6.1	Introduction	138
6.2	Color	138
6.3	Grayscales	142
6.4	Colorgroups and	
	palettes	142
6.5	Text backgrounds	147
6.6	Layout backgrounds	149
6.7	Overlays	150
6.8	METAPOST	152

The parameter factor makes only sense when the method line or dot is chosen. The param-

eter **screen** determines the 'grid' of the screen. Text on a screen of 0.95 is still readable.

Visually the $T_{E}X$ screens are comparable with POSTSCRIPT screens. When memory and time are non issues $T_{E}X$ screens come out more beautiful than postscript screens. There are many ways to implement screens but only the mentioned methods are implemented.

Behind the text in the pagebody screens can be typeset. This is done by enclosing the text with the commands:

 \startbackground

 \stopbackground

We have done so in this text. Backgrounds can cross page boundaries when necessary. Extra vertical whitespace is added around the text for reasons of readability.

\startbackground ... \stopbackground

The background can be set up with:

```
\setupbackground[...,.=..,..]leftoffsetdimensionrightoffsetdimensiontopoffsetdimensionbottomoffsetdimensionbeforecommandaftercommandstatestart stop
```

The command \background can be used in combination with for example placeblocks:

\placetable

..=..

```
{Just a table.}
\background
\starttable[|c|c|c]
\HL
\VL red \VL green \VL blue \VL \AR
\VL cyan \VL magenta \VL yellow \VL \AR
```

see p 257: \setupframed

	palettes	142
6.5	Text backgrounds	147
6.6	Layout backgrounds	149
6.7	Overlays	150
6.8	METAPOST	152

\HL \stoptable

The command **\background** expects an argument. Because a table is 'grouped' it will generate by itself and no extra braces are necessary.

\background

A fundamental difference between colors and screens is that screens are never converted. There is a command \startraster that acts like \startcolor , but in contrast to the color command, ConT_EXT does not keep track of screens across page boundaries. This makes sense, because screens nearly always are used as simple backgrounds.

6.6 Layout backgrounds

In interactive or screen documents the different screen areas may have different functions. Therefore the systematic use of backgrounds may seem obvious. It is possible to indicate all areas or compartments of the pagebody (screenbody). This is done with:

\setupbackgrounds[.1.][..,.2.,..][..,.=..,..]

- .1. top header text footer bottom page paper leftpage rightpage
- .2. leftedge leftmargin text rightmargin rightedge
- state <u>start</u> stop repeat
- ..=.. see p 257: \setupframed

Don't confuse this command with \setupbackground (singular). A background is only calculated when something has changed. This is more efficient while generating a document. When you want to calculate each background separately you should set the parameter state at repeat. The page background is always recalculated, since it provides an excellent place for page dependent buttons.

After \setupbackgrounds without any arguments the backgrounds are also re-calculated.

A specific part of the layout is identified by means of an axis (see figure 6.4).

You are allowed to provide more than one coordinate at a time, for example:

 \setup backgrounds

[header,text,footer]

6.1	Introduction	138
6.2	Color	138
6.3	Grayscales	142
6.4	Colorgroups and	
	palettes	142

Layout backgrounds

Figure 6.4 The coordinates in \setupbackgrounds.

[text]

[background=screen]

or

 \setup backgrounds

[text]

[text,rightedge]

[background=color,backgroundcolor=MyColor]

Some values of the paremeter page, like offset and corner also apply to other compartments, for example:

\setupbackgrounds [page]

[offset=.5\bodyfontsize]
depth=.5\bodyfontsize]

When you use menus in an interactive or screen document alignment is automatically adjusted for offset and/or depth. It is also possible to set the parameter page to the standard colors and screens.

If for some reason an adjustment is not generated you can use \setupbackgrounds (without an argument). In that case ConTEXT will calculate a new background.

6.7 Overlays

 T_EX has only limited possibilities to enhance the layout with specific features. In $ConT_EXT$ we have the possibility to 'add something to a text element'. You can think of a drawing made in some package or other ornaments. What we technically do is lay one piece of text over another piece text. That is why we speak of 'overlays'.

6.1	Introduction	138
6.2	Color	138
6.3	Grayscales	142
6.4	Colorgroups and	
	palettes	142
6.5	Text backgrounds	147
6.6	Layout backgrounds	149
6.7	Overlays	150
6.8	METAPOST	152

When we described the backgrounds you saw the paremeters color and screen. These are both examples of an overlay. You can also define your own background:

\defineoverlay[gimmick][\green a green text on a background]

∖framed

[height=2cm, background=gimmick, align=middle]

{at\\the\\foreground}

This would look like this:

```
at
a green text off a background
foreground
```

An overlay can be anything:

\defineoverlay

[gimmick]

[{\externalfigure[koe][width=\overlaywidth,height=\overlayheight]}]

∖framed

```
[height=2cm,width=5cm,background=gimmick,align=right]
```

{\vfill this is a cow}

We can see that in designing an overlay the width and height are available in macros. This enables us to scale the figure.

We can combine overlays with one another or with a screen and color.

The T_EX definitions look like this: \defineoverlay [gimmick]

5.1	Introduction	138
5.2	Color	138
5.3	Grayscales	142
6.4	Colorgroups and	
	palettes	142
5.5	Text backgrounds	147
6.6	Layout backgrounds	149
5.7	Overlays	150
5.8	METAPOST	152

f

f

[{\externalfigure[koe][width=\overlaywidth,height=\overlayheight]}] \defineoverlay [nextgimmick] [\red A Cow] \framed [height=2cm,width=.5\textwidth, background={screen,gimmick,nextgimmick},align=right] {\vfill this is a cow}

6.8 METAPOST

In a CONTEXT document we can use METAPOST code directly. For example:

startMPgraphic

fill unitsquare scaled 100 withcolor (.2,.3,.4); \stopMPgraphic

A direct relation with the CONT_EXT color mechanism is obvious:

\startMPgraphic

```
fill unitsquare scaled 100 withcolor \MPcolor{mark};
```

\stopMPgraphic

METAPOST support is very extensive. You can store definitions and re-use them at random. If possible processed METAPOST pictures are re-used.

A detailed discussion on embedding METAPOST graphics is beyond this manual, and therefore will be covered elsewhere. For the moment it is enough to know the basics of putting for instance graphics in the background. In the next example, a graphic is calculated each time it is refered to:

```
\startuseMPgraphic{test a}
```

fill unitsquare xscaled \overlaywidth yscaled \overlayheight ; \stopuseMPgraphic

\defineoverlay[A Nice Rectangle][\useMPgraphic{test a}]

\setupbackgrounds[page][background=A Nice Rectangle]

When the graphic does not change, we can best reuse it, like:

6.1	Introduction	138
6.2	Color	138
6.3	Grayscales	142
6.4	Colorgroups and	
	palettes	142
6.5	Text backgrounds	147
6.6	Layout backgrounds	149
6.7	Overlays	150
6.8	METAPOST	152

search	go back	exit
м	•	M

METAPOST

\startreusableMPgraphic{test b}

fill unitsquare xscaled \overlaywidth yscaled \overlayheight ;
\stopreusableMPgraphic

\defineoverlay[A Nice Rectangle][\reuseMPgraphic{test b}]

\setupbackgrounds[page][background=A Nice Rectangle]

When using the ConT_EXT command line interface T_E XEXEC, graphics are processed automatically. Unless one calls METAPOST at runtime, a second pass is needed to get the graphics in their final state.

Language specific issues

7.1 Introduction

One of the more complicated corners of $ConT_EXT$ is the department that deals with languages. Fortunately users will seldom notice this, but each language has its own demands and we put quite some effort in making sure that most of the issues on hyphenation rules and accented and non latin characters could be dealt with. For as long as it does not violate the $ConT_EXT$ user interface, we also support existing input schemes.

In the early days T_EX was very American oriented, but since T_EX version 3 there is (simultaneous) support for multiple languages. The input of languages with many accents —sometimes more accents per character— may look rather complicated, depending on the use of dedicated input encodings or special T_EX commands.

The situation is further complicated by the fact that specific input does not have a one-toone relation with the position of a glyph in a font. We discussed this in section 5.11. It is important to make the right choices for input and font encoding.

In this chapter we will deal with hyphenation and language specific labels. More details can be found in the language definition files (lang-xxx), the font files (font-xxx) and the encoding files (enco-xxx). There one can find details on how to define commands that deal with accents and special characters as covered in a previous chapter, sorting indexes, providing support for UNICODE, and more.

7.2 Automatic hyphenating

Each language has its own hyphenation rules. As soon as you switch to another language, $CONT_{E}XT$ will activate the appropriate set of hyphenation patterns for that language. Languages are identified by their official two character identifiers, like: Dutch (nl), English (en), German (de) and French (fr). A language is chosen with the following command:¹⁸

 $\language[...]$

71	Introduction	155
7.2	Automatic	155
7.2	hyphenating	155

7.7	Automatic translation	162
7.8	Composed words	162

search	go back	exit
м	•	M

^{... &}lt;u>nl</u> fr en uk de es cz ..

¹⁸ In case of any doubt please check if the hyphenation patterns are included in the fmt-file.

Some short cut commands are also available. They can be used enclosed in braces:

 $n \langle en \rangle de \langle fr \rangle v \langle v \rangle cz \dots$

The command \language[nl] can be compared with \nl. The first command is more transparant. The two character commands may conflict with existing commands. Take, for example, Italian and the code for *italic* type setting. For this reason we use capitals for commands that may cause any conflicts. One may also use the full names, like czech.

At any instance you can switch to another language. In the example below we switch from English to French and vice versa.

The French composer {\fr Olivier Messiaen} wrote \quote {\fr Quatuor pour la fin du temps} during the World War II in a concentration camp. This may well be one of the most moving musical pieces of that period.

We use these language switching commands if we cannot be certain that an alternative hyphenation pattern is necessary.

The French compos-	la fin du temps' dur-	camp. This may	pieces of that period.
er Olivier Messiaen	ing the World War	well be one of the	
wrote 'Quatuor pour	II in a concentration	most moving musical	

How far do we go in changing languages. Borrowed words like perestrojka and glasnost are often hyphenated okay, since these are Russian words used in an English context. When words are incorrectly hyphenated you can define an hyphenation pattern with the T_EX-command:

```
\hyphenation{ab-bre-via-tion}
```

You can also influence the hyphenation in a text by indicating the allowed hyphenation pattern in the word: at the right locations the command -is added: al-lo-wed.

7.3 Definitions and setups

When a format file is generated the hyphenation pattern one needs should be added to this file. The definition and installation of a language is therefore not transparant for the user. We show the process to give some insight in the mechanism. An example:¹⁹

\installlanguage

[en]

[spacing=broad,

7.1	Introduction	155

default=en,

state=stop]

and:

\installlanguage
[uk]
[default=en,
state=stop]

With the first definition you define the language component. You can view this definition in the file lang-ger.tex, the german languages. Languages are arranged in language groups. This arrangement is of no further significance at the moment. Since language definitions are preloaded, users should not bother about setting up such files.

The second definition inherits its set up from the English installation. In both definitions state is set at stop. This means that no patterns are loaded yet. That is done in the files cont-xx, the language and interface specific CONT_EXT versions. As soon as state is set at start, a new pattern is loaded, which can only be done during the generation of a format file.

We use some conventions in the file names of the patterns lang-xx.pat and the exceptions lang-xx.hyp. Normally a language is installed with a two character code. However there are three character codes, like deo for hyphenating 'old deutsch' and nlx the Dutch extended characterset, or 8-bit encoding. On distributions that come with patterns, the filenames mentioned can be mapped onto the ones available on the system. This happens in the file cont-usr.tex.

After installation you are not bound to the two character definitions. Default the longer (English) equivalents are defined:

\installlanguage[german][de]

"'all right' there we go" "all right 'there' we go"

We will discuss || in one of the next sections.

7.4 Date

Typesetting a date is also language specific so we have to pay some attention to dates here. When the computer runs at the actual time and date the system date can be recalled with:

```
\currentdate[..,...]
```

```
... see p 159: date
```

The sequence in which day, month and year are given is not mandatory. The pattern [day,month,year] results in 12 November 2001. We use \currentdate[weekday,month,day,{,},year] to obtain Monday November 12,2001.

A short cut looks like this: [dd,mm,yy] and will result in 121101. Something like [d,m,y] would result in 12112001 and with [referral] you will get a 20011112. Combinations are also possible. Characters can also be added to the date pattern. The date 12-11-01 is generated by the pattern [dd,--,mm,--,yy].

A date can be (type)set with the command:

```
\date[..,.=..,.][..,...]
d number
m number
y number
... day month weekday year dd mm jj yy d m j y referral
```

The first (optional) argument is used to specify the date:

\date[d=10,m=3,y=1996][weekday,month,day, year]

When no argument is given you will obtain the actual date. When the second argument is left out the result equals that of \currentdate. The example results in:

7.5 Labels and heads

In some cases $ConT_EXT$ will generate text labels automatically, for example the word **Figure** is generated automatically when a caption is placed under a figure. These kind of words are called textlabels. Labels can be set with the command:

```
\setuplabeltext[...][..=..]
... nl fr en uk de es cz ..
name text
```

Relevant labels are: table, figure, chapter, appendix and comparable text elements. An example of such a set up is:

```
\setuplabeltext[en][chapter=Chapter ]
\setuplabeltext[n1][hoofdstuk=Hoofdstuk ]
```

The space after Chapter is essential, because otherwise the chapternumber will be placed right after the word Chapter (Chapter1 instead of Chapter 1). A labeltext can recalled with:

```
\labeltext{...}
... text
```

Some languages, like Chinese, use split labels. These can be passed as a comma separated list, like chapter={left,right}.

Titleheads for special sections of a document, like abbreviations and appendices are set up with:

```
\setupheadtext[...][..=..]
... <u>nl</u> fr en uk de es cz ..
name text
```

Examples of titleheads are Content, Tables, Figures, Abbreviations, Index etc. An example definition looks like:

```
\setupheadtext[content=Content]
```

search	go back	exit	
м	•		

A header can be recalled with:

```
\headtext{...}
```

Labels and titleheads are defined in the file lang-xxx. You should take a look in these files to understand the use of titleheads and labels.

The actual language that is active during document generation does not have to be the same language that is used for the labels. For this reason next to \language we have:

```
\mainlanguage[...]
... <u>nl</u> fr en uk de es cz ..
```

When typesetting a document, there is normally one main language, say \mainlanguage[en]. A temporary switch to another language is then accomplished by for instance \language[nl], since this does not influence the labels and titles. language.

7.6 Language specific commands

German T_EX users are accustomed to entering "e and getting ë typeset in return. This and a lot more are defined in lang-ger using the compound character mechanism built in CoNT_EXT. Certain two or three character combinations result in one glyph or proper hyphenation. The example below illustrates this. Some macros are used that will not be explained here. Normally, users can stick to simply using the already defined commands.

```
\startlanguagespecifics[de]
```

```
\installcompoundcharacter "a {\moveaccent{-.1ex}\"a\midworddiscretionary}
\installcompoundcharacter "s {\SS}
.....
\installcompoundcharacter "U {\smashaccent\"U}
\installcompoundcharacter "Z {SZ}
.....
\installcompoundcharacter "ck {\discretionary {k-}{k}{ck}}
\installcompoundcharacter "TT {\discretionary{TT-}{T}}
.....
```

\installcompoundcharacter "' {\handlequotation\c!leftquotation} \stoplanguagespecifics

The command \installcompoundcharacter takes care of the German type setting, "a is converted to \ddot{a} , "U in \ddot{U} , "ck for the right hyphenation, etc. One can add more definitions, but this will violate portability. In a Polish CONT_EXT the / is used instead of a ".

7.7 Automatic translation

It is possible to translate a text automatically in the actual language. This may be comfortable when typesetting letterheads. The example below illustrates this.

```
\translate[..,.=..,.]
name text
```

It depends on the actual language whether a labeltext is type set in English {\en as an \translate [en=example, fr=exemple], \fr or in French as an \translate}.

The second command call \translate uses the applied values. That is, \translate with no options uses the options of the last call to \translate.

It depends on the actual language whether a labeltext is type set in English as an example, or in French as an exemple.

7.8 Composed words

Words consisting of two separate words are often separated by an intra word dash, as in x-axis. This dash can be placed between | |, for example |--|. This command, which does not begin with a $\$, serves several purposes. When | | is typed the default intra word dash is used, which is --. This dash is set up with:

```
\setuphyphenmark[..=..]
sign ______ (= /
```

The is also used in word combinations like (intra)word, which is typed as (intra) word.
The mechanism is not foolproof but it serves most purposes. In case the hyphenation is
incorrect you can hyphenate the first word of the composed one by hand: (in\-tra) word.

input	normal	hyphenated
intra word	intra-word	in-tra-word
intra - word	intra-word	in-tra-word
intra (word)	intra(word)	in-tra(-word)
(intra) word	(intra)word	(in-tra-)word
intra word	intra-word	in-tra-word
intra ~ word	intra word	in-tra-word

Table 7.1Hyphenation of composed words.

The main reason behind this mechanism is that T_EX doesn't really know how to hyphenate composed words and how to handle subsentences. T_EX know a lot about math, but far less about normal texts. Using this command not only serves consistency, but also makes sure that T_EX can break compound words at the right places. It also keeps boundary characters at the right place when a breakpoint is inserted.

Text elements

8.1 Introduction

The core of CONTEXT is formed by the commands that structures the text. The most common structuring elements are chapters and sections. The structure is visualized by means of titles and summarized in the table of contents.

A text can be subdivided in different ways. As an introduction we use the methods of H. van Krimpen, K. Treebus and the Collectief Gaade. First we examine the method of van Krimpen:

7. list of illustrations

8. acknowledgement

11. notes

12. literature

13. register(s)

14. colofon

- 1. French title
- 2. title
- 3. history & copyright
- 4. mission
- 9. errata

6. ...

5. preface/introduction 10. the content

The French title is found at the same spread as the back of the cover, or first empty sheet. In the colofon we find the used font, the names of the typesetter and illustrator, the number of copies, the press, the paper, the binding, etc.

The subdivision of Treebus looks like this:

1.	French title	8.	list of illustrations	15.	literature	
2.	titlepage	9.	introduction/preface (2)	16.	used words	
3.	colofon	10.		17.	addenda	
4.	copyright	11.	epilogue	18.	register	
5.	mission	12.	appendices	19.	acknowledgement	pho-
6.	preface (1)	13.	summaries		tos	
7.	table of content	14.	notes	20.	(colofon)	

In this way of dividing a text the colofon is printed on the back of the titlepage. The first preface is written by others and not by the author.

The last text structure is that of the Collectief Gaade:

1.	French title	4.	copyright	7.	preface
2.	series title	5.	mission	8.	table of content
3.	title	6.	blank	9.	introduction

8

12. notes	15. bibliography	

Since there seems to be no standardized way of setting up a document, $ConT_{E}XT$ will only provide general mechanisms. These are designed in such a way that they meet the following specifications:

- 1. In a text the depth of sectioning seldom exceeds four. However, in a complex manuals more depth can be useful. In paper documents a depth of six may be very confusing for the reader but in electronic documents we need far more structure. This is caused by the fact that a reader cannot make a visual representation of the electronic book. Elements to indicate this structure are necessary to be able to deal with the information.
- 2. Not every level needs a number but in the background every level is numbered to be able to refer to these unnumbered structuring elements.
- 3. The names given to the structuring elements must be a logical ones and must relate to their purpose.
- 4. It is possible to generate tables of contents and registers at every level of the document and they must support complex interactivity.
- 5. A document will be divided in functional components like introductions and appendices with their respective (typographical) characteristics.
- 6. The hyphenation of titles must be handled correctly.
- 7. Headers and footers are supported based on the standard labels used in a document. For example chapter in a book and procedure in a manual.
- 8. A ConT_EXT user must be able to design titles without worrying about vertical and horizontal spacing, referencing and synchronisation.

These prerequisites have resulted in a heavy duty mechanism that works in the background while running $CONT_{E}XT$. The commands that are described in the following sections are an example of an implementation. We will also show examples of self designed titles.

8.2 Subdividing the text

A text is divided in chapters, sections, etc. with the commands:

content	commands
index	macros

8.1	Introduction	165
8.2	Subdividing the text	166
8.3	Variations in titles	170
8.4	Meta-structure	176
8.5	Alternative	
	mechanisms	177

8

\part[*ref*,..]{...}

... text

 $\chapter[ref,..]{...}$

... text

 $\section[ref,..]{...}$

... text

\subsection[ref,..]{...}

... text

\subsubsection[ref,..]{...}

... text

and

 $title[ref,..]{...}$

... text

 $\subject[ref,..]{...}$

... text

\subsubject[ref,..]{...}

... text

8.1	Introduction	165
8.2	Subdividing the text	166
8.3	Variations in titles	170
8.4	Meta-structure	176
8.5	Alternative	
	mechanisms	177

search	go back	exit
м	•	M

```
\subsubsubject[ref,..]{...}
... text
```

The first series of commands (\chapter ...) generate a numbered head, with the second series the titles are not numbered. There are a few more levels available than those shown above.

level	numbered title	unnumbered title
1	\part	
2	\chapter	\title
3	\section	\subject
4	\subsection	\subsubject
5	\subsubsection	\subsubsubject

Table 8.1The structuring elements.

By default \part generates *no* title because most of the times these require special attention and a specific design. In the background however the partnumbering is active and carries out several initialisations. The other elements are set up to typeset a title.

A structuring element has two arguments. The first argument, the reference, makes it possible to refer to the chapter or section from another location of the document. In chapter 9 this mechanism is described in full. A reference is optional and can be left out.

```
\section{Subdividing a text}
```

 $ConT_EXT$ generates automatically the numbers of chapters and sections. However there are situations where you want to enforce your own numbering. This is also supported.

```
\setuphead[subsection][ownnumber=yes]
\subsection{399}{The old number}
\subsection[someref]{400}{Another number}
```

In this example an additional argument appears. In the background ConT_{E} XT still uses its own numbering mechanism, so operations that depend upon a consistent numbering still work okay. The extra argument is just used for typesetting the number. This user-provided number does not have to be number, it may be anything, like ABC-123.

399 The old number

8.1	Introduction	165
8.2	Subdividing the text	166
8.3	Variations in titles	170
8.4	Meta-structure	176
8.5	Alternative	
	mechanisms	177

400 Another number

You can automatically place titles of chapters, sections or other structuring elements in the header and footer with the marking mechanism. Titles that are too long can be shortened by:

 $\nomarking{...}$

text . . .

For example:

```
\chapter{Influences \nomarking{in the 20th century:} an introduction}
```

The text enclosed by \nomarking is replaced by dots in the header or footer. Perhaps an easier strategy is to use the automatic marking limiting mechanism. The next command puts the chapter title left and the section title right in the header. Both titles are limited in length.

```
\setupheadertexts[chapter][section]
\setupheader[leftwidth=.4\hsize,rightwidth=.5\hsize]
```

A comparable problem may occur in the table of contents. In that case we use \nolist:

\chapter{Influences in the 20th century\nolist{: an introduction}}

When you type the command \setminus in a title a new line will be generated at that location. When you type \crlf in a title you will enforce a new line only in the table of contents. For example:

```
\chapter{Influences in the 20th century:\crlf an introduction}
```

This will result in a two line title in the table of context, while the title is only one line in the text.

It is possible to define your own structuring elements. Your 'own' element is derived from an existing text element.

```
\det[.1.][.2.]
.1.
     name
```

```
.2.
       section
```

An example of a definition is:

```
\definehead[category][subsubject]
```

From this moment on the command \category behaves just like \subsubject, i.e., \category *inherits* the default properties of \subsubject. For example, \category is not numbered.

8.1	Introduction	165
8.2	Subdividing the text	166
8.3	Variations in titles	170
8.4	Meta-structure	176
8.5	Alternative	
	mechanisms	177

A number of characteristics available with \setuphead are described in section 8.3. Your own defined structuring elements can also be set up. The category defined above can be set up as follows:

```
\setuphead[category][page=yes]
```

This setup causes each new instance of category to be placed at the top of a new page.

We can also block the sectionnumbering with setupheads[sectionnumber=no]. Sectionnumbering will stop but ConT_EXT will continue the numbering on the background. This is necessary to be able to perform local actions like the generating local tables of content.

In defining your own structuring elements there is always the danger that you use existing $T_{E}X$ or $CONT_{E}XT$ commands. It is of good practice to use capitals for your own definitions. For example:

\definehead[WorkInstruction][section]

8.3 Variations in titles

The numbering and layout of chapters, sections and subsections can be influenced by several commands. These commands are also used in the design of your own heads. We advise you to start the design process in one of the final stages of your document production process. You will find that correct header definitions in the setup area of your source file will lead to a very clean source without any layout commands in the text.

The following commands are at your disposal:

8.1	Introduction	165
8.2	Subdividing the text	166
8.3	Variations in titles	170
8.4	Meta-structure	176
8.5	Alternative	
	mechanisms	177

8.5	Alternative	
	mechanisms	177

search	go back	exit
M	•	N

\setupheadnumber[.1.][.2.]

.1. section

.2. number + number - number

This command accepts absolute and relative numbers, so [12], [+2] and [+]. The relative method is preferred, like:

\setuphead[chapter][+1]

This command is only used when one writes macros that do tricky things with heads. A number can be recalled by:

\headnumber[...]

... section

and/or:

 \currentheadnumber

For example:

```
\currentheadnumber : 8.3
\headnumber[chapter] : 8
\headnumber[section] : 8.3
```

When you want to use the titlenumber in calculations you must use the command \currentheadnumber. This number is calculated by and available after:

```
\determineheadnumber[...]
```

When headers and footers use the chapter and section titles they are automatically adapted at a new page. The example below results in going to new right hand side page for each chapter.

\setuphead

```
[chapter]
[page=right,
  after={\blank[2*big]}]
```

8.1	Introduction	165
8.2	Subdividing the text	166
8.3	Variations in titles	170
8.4	Meta-structure	176
8.5	Alternative	
	mechanisms	177

search	go back	exit
м	•	M

In extensive documents you can choose to start sections on a new page. The title of the first section however should be placed directly below the chapter title. You can also prefer to start this first section on a new page. In that case you set continue at no. Figure 8.1 shows the difference between these two alternatives.

\setuphead

[section]

[page=yes,continue=no, after=\blank]

chapter 1	section 1.2	section 1.3	
section 1.1			
chapter 1	section 1.1	section 1.2	section 1.3

Figure 8.1 Two alternatives for the first section.

It is also possible that you do not want any headers and footers on the page where a new chapter begins. In that case you should set header at empty, high, nomarking or an identification of a self defined header (this is explained in section 4.17).

By default the titles are typeset in a somewhat larger font. You can set the text and number style at your own chosen bodyfont. When the titles make use of the same body font (serif, sans, etc.) as the running text you should use neutral identifications for these fonts. So you use \tfb instead of \rmb. Font switching is also an issue in titles. For example if we use \ssbf instead of \ss\bf there is a chance that capitals and synonyms are not displayed the way they should. So you should always use the most robust definitions for fontswitching. Commands like \kap adapt their behaviour to these switchings.

A chapter title consists of a number and a text. It is possible to define your own command that typesets both components in a different way.

8.1	Introduction	165
8.2	Subdividing the text	166
8.3	Variations in titles	170
8.4	Meta-structure	176
8.5	Alternative	
	mechanisms	177

search	go back	exit
H	•	M

8.3.1 Title alternative equals normal

8.3.2 Title alternative equals inmargin

Title alternative equals middle

These titles were generates by:

\setupheads[alternative=normal]
\subsection{Title alternative equals normal}
\setupheads[alternative=inmargin]
\subsection{Title alternative equals inmargin}
\setupheads[alternative=middle]
\subsubject{Title alternative equals middle}

In this manual we use a somewhat different title layout. The design of such a title is time consuming, not so much because the macros are complicated, but because cooking up something original takes time. In the examples below we will show the steps in the design process.

$def\HeadTitle#1#2\%$

```
{\hbox to \hsize
```

{\hfill % the % after {#1} suppresses a space

- \framed[height=1cm,width=2cm,align=left]{#1}%
- \framed[height=1cm,width=4cm,align=right]{#2}}}

\setuphead[subsection][command=\HeadTitle]

8.3.3 Title

A reader will expect the title of a section on the left hand side of the page, but we see an alternative here. The title is at the right hand side. One of the advantages of using \framed is, that turning frame=on, some insight can be gained in what is happening.

8.3.4 Another title

This alternative looks somewhat better. The first definition is slightly altered. This example also shows the features of the command \framed.

\def\HeadTitle#1#2%
{\hbox to \hsize \bgroup
 \hfill

8.1	Introduction	165
8.2	Subdividing the text	166
8.3	Variations in titles	170
8.4	Meta-structure	176
8.5	Alternative	
	mechanisms	177

seare	ch	go l	back	exit	
M		•		M	1

\setupframed[height=1cm,offset=.5em,frame=off]
\framed[width=2cm,align=left]{#1}%
\framed[width=4cm,align=right,leftframe=on]{#2}%
\egroup}

\setuphead

```
[subsection]
[command=\HeadTitle,
style=\tfb]
```

We see that the font is set with the command \setuphead . These font commands should not be placed in the command \HeadTitle . You may wonder what happens when $ConT_EXT$ encounters a long title. Here is the answer.

8.3.5 A somewhat

Since we have fixed the height at 1cm, the second line of the title end up**Ongerheitten**e. We will solve that problem in the next alternative. A \tbox provides a top aligned box.

```
def HeadTitle#1#2\%
```

```
{\hbox to \hsize \bgroup
 \hfill
 \setupframed[offset=.5em,frame=off]
 \tbox{\framed[width=3cm,align=left]{#1}}%
 \tbox{\framed[width=4cm,align=right,leftframe=on]{#2}}%
 \egroup}
```

 \setuphead

[subsection] [command=\HeadTitle]

This definition results in a title and a number that align on their first lines (due to \tbox).

```
8.3.6 A consider-
ably longer ti-
tle
```

When the title design becomes more complex you have to know more of $T_{E}X$. Not every design specification can be foreseen.

8.1	Introduction	165

```
\setuphead[subsubject] [alternative=text,style=bold]
\setuphead[subsubsubject][alternative=text,style=slantedbold]
```

Titles in the text *Why are titles in the text more difficult to program in* T_EX *than we may expect beforehand.* The answer lies in the fact that CONT_EXT supports the generation of parallel documents. These are documents that have a printable paper version and an electronic screen version. These versions are coupled and thus hyperlinked by their titles. This means that when you click on a title you will jump to the same title in the other document. So we *couple* document versions:

\coupledocument

[screenversion]

[repman-e]

[chapter, section, subsection, subsubsection, part, appendix]

[The Reporting Manual]

\setuphead

[chapter, section, subsection, subsubsection, part, appendix]

[file=screenversion]

The first argument in \coupledocument identifies the screen document and the second argument specifies the file name of that document. The third argument specifies the coupling and the fourth is a description. After generating the documents you can jump from one version to another by just clicking the titles. This command only preloads references, the actual coupling is achieved by \setuphead command. Because titles in a text may take up several lines some heavy duty manipulation is necessary when typesetting such titles as we will see later.

8.4 Meta-structure

You can divide your document in functional components. The characteristics of the titles may depend in what component the title is used. By default we distinguish the next functional components:

• frontmatter • bodypart • appendices • backmatter

Introductions and extroductions are enclosed by \start ... \stop constructs. In that case the titles will not be numbered like the chapters, but they are displayed in the table of contents. Within the component 'bodypart' there are no specific actions or layout manipulations, but in the 'appendices' the titles are numbered by letters (A, B, C, etc.).

\stopbackmatter

When this code is processed, you will see that commands like \title and \subject never appear in the table of content and never get a number. Their behaviour is not influenced by the functional component they are used in. The behaviour of the other commands depend on the setup within such a component. Therefore it is possible to adapt the numbering in a functional component with one parameter setup.

8.5 Alternative mechanisms

Not every document can be structured in chapters and sections. There are documents with other numbering mechanisms and other ways to indicate levels in the text. The title mechanism supports these documents.

At the lowest level, the macros of $ConT_EXT$ do not work with chapters and sections but with sectionblocks. The chapter and section commands are predefined sectionblocks. In dutch this distinction is more clear, since there we have \hoofdstuk and \paragraaf as instances of 'secties'.

8.1	Introduction	165

 $\definesection[...]$

... name

```
\setupsection[.1.][.2.][..,..=..,..]
```

.1.name.2.nameconversionnumbers characters Characters romannumerals Romannumeralspreviousnumberyes no

By default there are four sectionblocks:

\definesectionblock	[bodypart]	[headnumber=yes]
\definesectionblock	[appendices]	[headnumber=yes]
\definesectionblock	[introductions]	[headnumber=no]
\definesectionblock	[extroductions]	[headnumber=no]

We see that numbering is set with these commands. When numbering is off local tables of contents can not be generated. When numbers are generated but they do not have to be displayed you can use \setupheads[sectionnumber=no].

By default every sectionblock starts at a new (right hand side) page. This prevents markings from being reset too early. A new page is enforced by page.

In CONTEXT there are seven levels in use but more levels can be made available.

\definesection [section-1]

\definesection [section-7]

There are a number of titles predefined with the command \definehead. We show here some of the definitions:

```
\definehead [part] [section=section-1]
\definehead [chapter] [section=section-2]
\definehead [section] [section=section-3]
```

The definition of a subsection differs somewhat from the others, since the subs inherit the characteristics of a section:

\definehead

```
[subsection]
[section=section-4,
default=section]
```

The definitions of unnumbered titles and subjects are different because we don't want any numbering:

\definehead

```
[title]
[coupling=chapter,
  default=chapter,
  incrementnumber=no]
```

The unnumbered title is coupled to the numbered chapter. This means that in most situations the title is handled the same way as a chapter. You can think of the ways new pages are generated at each new unnumbered title or chapter. Characteristics like the style and color are also inherited.

There is more to consider. The predefined sectionblocks are used in appendices, because these have a different numbering system.

```
\setupsection
[section-2]
[appendixconversion=Character, % Watch the capital
previousnumber=no]
\setuphead
[part]
[placehead=no]
```

8.1	Introduction	165
8.2	Subdividing the text	166
8.3	Variations in titles	170
8.4	Meta-structure	176
8.5	Alternative	
	mechanisms	177

\setuphead
 [chapter]
 [appendixlabel=appendix,
 bodypartlabel=chapter]

This means that within an appendix conversion from number to character takes place, but only at the level of section 2. Furthermore the titles that are related to section-2 do not get a prefix in front of the number. The prefix consists of the separate numbers of the sectionblocks:

```
<section-1><separator><section-2><separator><section-3> etc.
```

By default section 2 (appendix) will be prefixed by the partnumber and a separator (.) and this is not desirable at this instance. At that level we block the prefix mechanism and we prevent that in lower levels (section 3 ...) the partnumber is included.

In the standard setup of CONT_EXT we do not display the part title. You can undo this by saying:

```
\setuphead[part][placehead=yes]
```

Chapters and appendices can be labeled. This means that the titles are preceded with a word like *Chapter* or *Appendix*. This is done with \setuplabeltext, for example:

```
\setuplabeltext[appendix=Appendix~]
```

The look of the titles are defined by \setuphead . ConT_EXT has set up the lower level section headings to inherit their settings from the higher level. The default setups for ConT_EXT are therefore limited to:

```
\setuphead
```

```
[part,chapter]
[align=normal,
  continue=no,
  page=right,
  head=nomarking,
  style=\tfc,
  before={\blank[2*big]},
  after={\blank[2*big]}]
\setuphead
```

```
[section]
[align=normal,
```

```
style=\tfa,
```

3.1	Introduction	165
3.2	Subdividing the text	166
3.3	Variations in titles	170
3.4	Meta-structure	176
3.5	Alternative	
	mechanisms	177

```
before={\blank[2*big]},
after=\blank]
```

With nomarking, we tell $ConT_EXT$ to ignore markings in running heads at the page where a chapter starts. We prefer \tfc, because this enables the title to adapt to the actual bodyfont. The around \blank are essential for we do not want any conflicts with [].

Earlier we saw that new structuring elements could be defined that inherit characteristics of existing elements. Most of the time this is sufficient:

```
\definehead[topic] [section][style=bold,before=\blank]
\definehead[category][subject][style=bold,before=\blank]
```

One of the reasons that the mechanism is rather complex is the fact that we use the names of the sections as setups in other commands. The marking of category can be compared with that of subject, but that of subject can not be compared with that section. During the last few years it appeared that subject is used for all sorts of titles in the running text. We don't want to see these in headers and footers.

While setting the parameter criterium in lists and registers and the way of numbering, we can choose persection or persubject. For indicating the level we can use the parameter section as well as subject. So we can alter the names of sections in logical ones that relate to their purpose. For example:

\definehead	[handbook]	[section=section-1]
\definehead	[procedure]	[section=section-2]
\definehead	[subprocedure]	[section=section-3]
\definehead	[instruction]	[procedure]

After this we can set up the structuring elements (or inherit them) and generate lists of procedures and instructions. We will discuss this feature in detail in one of the later chapters.

9.1 Table of contents

The table of contents is very common in books and is used to refer to the text that lies ahead. Tables of content are generated automatically by:

placecontent

The table of contents shows a list of chapters and sections but this depends also on the location where the table of contents is summoned. Just in front of a chapter we will obtain a complete table. But just after the chapter we will only obtain a list of relevant sections or subsections. The same mechanism also works with sections and subsections.

\chapter{Mammals}
\placecontent
\section{Horses}

A table of contents is an example of a combined list. Before discussing combined lists we go into single lists. A single list is defined with:

```
\definelist[.1.][.2.][..,..=..,..]
```

```
.1. name
.2. name
```

```
..=.. see p 185: \setuplist
```

An example of such a definition is:

```
\definelist[firstlevel]
```

Such a list is recalled with:

```
\placelist[firstlevel]
```

Each list may have its own set up:

\setuplist[firstlevel][width=2em]

Lists can be set up simultaneously, for example:

\setuplist[firstlevel,secondlevel][width=2em]

To generate a list you type:

9

9.1	Table of contents	183
9.2	Synonyms	196
9.3	Sorting	199
9.4	Marking	201
9.5	Cross references	204
9.6	Predefined references	211
9.7	Registers	211

search	go back	exit
M	•	N

```
\placelist[..,...][..,..=..,..]
... name
```

..=.. see p 185: \setuplist

The layout of a list is determined by the values of alternative (see table 9.1), margin, width and distance. The alternatives a, b and c are line oriented. A line has the following construct:

margin	width	distance	
	headnumber		head and pagenumber
			F

In a paper document it is sufficient to set up width. In an interactive document however the width determines the clickable area.²⁰

In alternative d the titles in the table will be type set as a continuous paragraph. In that case the before and after have no meaning. The distance, that is 1em at a minimum, relates to the distance to the next element in the list. The next set up generates a compact table of contents:

```
\setuplist
  [chapter]
  [before=\blank,after=\blank,style=bold]
  \setuplist
  [section]
  [alternative=d,left=(,right=),pagestyle=slanted,prefix=no]
```

Since both lists are defined already when defining the sectioning command, we do not define them here. The parameter prefix indicates whether the preceding level indicator numbering is used. In this alternative the prefix is not used. Alternative d looks like this:

(1) Table of contents 183 (2) Synonyms 196 (3) Sorting 199 (4) Marking 201

(5) Cross references 204 (6) Predefined references 211 (7) Registers 211

When alternative is set to d, an element in the list has the following construction:

left headnumber right head page distance

maxwidth	dimension
=	see p 252: \framed

When you define a title you also define a list. This means that there are standard lists for chapters, sections and subsections, etc. available.

These (sub)sections can be combined into one combined list. The default table of contents is such a combined list:

96
99
)1
)4
1
1

 $\define combined list$

[content]

[part,

chapter, section, subsection, subsubsection,

- subsubsubsection, subsubsubsubsection]
- [level=subsubsubsubsection,
- criterium=local]

The alternative setups equals that of the separate lists.

\definecombinedlist[.1.][..,.2.,..][..,.=..,..]

- .1. *name*
- .2. list
- ..=.. see p 186: \setupcombinedlist

```
\setupcombinedlist[...][..,.=..,.]
```

... name
level 1234 section current
..=.. see p 185: \setuplist

These commands themselves generate the commands:

```
\completecombinedlist[...][..,.=..,.]
```

... name

..=.. see p 186: \setupcombinedlist

\placecombinedlist[...][..,.=..,.]

... name
...=.. see p 186: \setupcombinedlist

The first command places a title at the top of the list. This title

The first command places a title at the top of the list. This title is unnumbered because we do not want the table of contents as an element in the list. In the next section we will discuss lists where the numbered title \chapter is used.

9.1	Table of contents	183

d	number – title – pagenumber (continuous)
e	title (framed)
f	title (left, middle or right aligned)
g	title (centered)

Table 9.1Alternatives in combined lists.

Possible alternatives are summed up in table 9.1. There are a number of possible variations and we advise you to do some experimenting when you have specific wishes. The three parameters width, margin and style are specified for all levels or for all five levels separately.

\setupcombinedlist
[content]
[alternative=c,
aligntitle=no,
width=2.5em]

The parameter aligntitle forces entries with no section number (like titles, subjects and alike) to be typeset onto the left margin. Otherwise the title is aligned to the numbered counterparts (like chapter, section and alike). Compare:

title
12 chapter
itile
i12 chapter
itile
12 chapter
You can also pass setup parameters to the \place... commands. For example:
\placecontent[level=part]

content commands index macros

Table of contents

In this situation only the parts are used in the displayed list. Instead of an identifier, like part or chapter, you can also use a number. However this suggests that you have some insight in the level of the separate sections (part=1, chapter=2 etc.)

A table of contents may cross the page boundaries at an undesired location in the list. Pagebreaking in tables of content can hardly be automated. Therefore it is possible to adjust the pagebreaking manually. The next example illustrates this.

\completecontent[pageboundaries={2.2,8.5,12.3.3}]

This kind of 'fine-tuning' should be done at the end of the production proces. When the document is revised you have to evaluate the pagebreaking location. $CONT_EXT$ produces terminal feedback to remind you when these kind of commands are in effect.

Before a list can be generated the text should be processed twice. When a combined list is not placed after the text is processed twice you probably have asked for a local list.

There are two commands to write something directly to a list. The first command is used to add an element and the second to add a command:

```
\writetolist[.1.]{.2.}{.3.}
```

```
.1. section name
```

```
\writebetweenlist[.1.]{.2.}
```

```
.1. section name
```

We supply a simple example:

```
\writebetweenlist [section] {\blank}
\writetolist [section] {---} {from here temporary}
\writebetweenlist [section] {\blank}
```

The next command is used in situations where information goes into the title but should not go into the list.

\nolist{...}

Consider for example the following example:

9.2 Synonyms 196 9.3 Sorting 199 201 9.4Marking 9.5 Cross references 204 Predefined references 211 9.6 211 9.7 Registers

search

9

CO

9.1

\definehead[function][ownnumber=yes]
\function{A-45}{manager logistics \nolist{(outdated)}}
\placelist[function][criterium=all]

When we call for a list of functions, we will get (...) instead of (outdated). This can be handy for long titles. Keep in mind that each head has a corresponding list.

In an interactive document it is common practice to use more lists than in a paper document. The reason is that the tables of content is also a navigational tool. The user of the interactive document arrives faster at the desired location when many subtables are used, because clicking is the only way to get to that location.

In designing an interactive document you can consider the following setup (probably in a different arrangement):

```
\setuplayout[rightedge=3cm]
\setupinteractions[state=start,menu=on]
\setupinteractionmenu[right][state=start]
\startinteractionmenu[right]
  \placecontent
    [level=current, criterium=previous,
```

```
alternative=f, align=right,
interaction=all,
before=, after=]
```

```
\stopinteractionmenu
```

These definitions make sure that a table of contents is typeset at every page (screen) in the right edge. The table displays the sections one level deeper than the actual level. So, for each section we get a list of subsections.

When you produce an interactive document with a table of contents at every level you can make a (standard) button that refers to [previouscontent]. This reference is generated automatically.

The list elements that are written to a list are not expanded (that is, commands remain commands). When expansion is needed you can set the parameter expansion. Expansion is needed in situations where you write variable data to the list. This is seldom the case.

In a more extensive document there may occur situations where at some levels there are no deeper levels available. Then the table of contents at that level is not available either. In that case you need more information on the list so you can act upon it. You can have access to:

9.1	Table of contents	183

Within a list entry, each element can be made interactive. In most cases, in screen documents, the option all is the most convenient one. Alternative e is rather well suited for screen documents and accepts nearly all parameters of \framed. In the next example we use a symbol instead of a sectionnumber. The parameter depth applies to this symbol.

At p 183 we discuss *Table of contents*; At p 196 we discuss *Synonyms*; At p 199 we discuss *Sorting*; At p 201 we discuss *Marking*; At p 204 we discuss *Cross references*; At p 211 we discuss *Predefined references*; At p 211 we discuss *Registers*;

As an alternative for none, we can use horizontal and vertical. Both commands have their spacing tuned for typesetting lists in for instance menus.

9.2 Synonyms

In many texts we use abbreviations. An abbreviation has a meaning. The abbreviation and its meaning have to be used and typeset consistently throughout the text. We do not like to see ABC and in the next line an ABC. For this reason it is possible to define a list with the used abbreviations and their meanings. This list can be recalled and placed at the beginning or end of a book for the convenience of the reader.

The use of abbreviations is an example of the synonym mechanism. A new category of synonyms is defined with the command:

```
\definesynonyms[.1.][.2.][.3.][.4.]
.1.
.2. plural name
.3. command
.4. command
```

The way the list is displayed can be influenced by:

\setupsynon	yms[][,.=,.]
textstyle synonymstyle location width state criterium conversion expansion	<pre>name normal bold slanted boldslanted type cap small command normal bold slanted boldslanted type cap small command left right top serried inmargin inleft inright dimension start stop all used yes no ves command no</pre>
command	\command#1#2#3

Abbreviations are defined with the command:

9.1	Table of contents	183
9.2	Synonyms	196
9.3	Sorting	199
9.4	Marking	201
9.5	Cross references	204
9.6	Predefined references	211
9.7	Registers	211

9

\definesynonyms[abbreviation][abbreviations][\infull]

We will explain the optional fourth argument later. After this definition a new command **\abbreviation** is available. An example of the use of abbreviations is:

\abbreviation {UN} {United Nations}

\abbreviation {UK} {United Kingdom}

\abbreviation {USA} {United States of America}

The meaning can be used in the text by:

\infull{abbreviation}

It is also possible to add commands in the abbreviation. In that case the command must be typed literally between the []:

\abbreviation [TEX] {\TeX} {The \TeX\ Typesetting System}

Recalling such an abbreviation is done with \TEX and the meaning can be fetched with \infull {TEX}. In a running text we type \TEX\ and in front of punctuation \TEX.

A synonym is only added to a list when it is used. When you want to display all defined synonyms (used and not used) you have to set the parameter criterium at all. By setting state at stop you will prevent list elements to be the added to the list even when they are used. This can be a temporary measure:

```
\setupsynonyms[abbreviation][state=stop]
\abbreviation {NIL} {Not In List}
\setupsynonyms[abbreviation][state=start]
```

Here we left out the optional first argument, in which case the abbreviation itself becomes the command (\NIL). So, in this case the next two definitions are equivalent:

\abbreviation [NIL] {NIL} {Not In List}
\abbreviation {NIL} {Not In List}

The formal definition of a synonym looks like this:

```
\synonym[.1.]{.2.}{.3.}
.1. text
```

```
.2. text
```

```
.3. text
```

A list of synonyms is generated by:

9.1	Table of contents	183
9.2	Synonyms	196
9.3	Sorting	199
9.4	Marking	201
9.5	Cross references	204
9.6	Predefined references	211
9.7	Registers	211

\placelistof*synonyms*

The next command generates a list with a title (\chapter):

\completelistof*synonyms*

Here we see why we typed the plural form during the definition of the synonym. The plural is also used as the title of the list and the first character is capitalized. The title can be altered with \setuphead (see section 8.3).

Synonyms are only available after they are used. There are instances when the underlying mechanism cannot preload the definitions. When you run into such troubles, you can try to load the meaning of the synonyms with the command:

```
\loadsynonyms
```

For instance, the meaning of abbreviations can be loaded with \loadabbreviations. In order to succeed, the text has to be processed at least once. Don't use this command if things run smoothly.

Next to the predefined abbreviations we also defined the sI-units as synonyms. These must be loaded as a separate module. We will discuss this in section ??.

The attentive reader has seen that the command \definesynonyms has four arguments. The fourth argument is reserved for a command with which you can recall the synonym. In this way the synonyms are protected from the rest of the ConTEXT commands and there will be no conflicts using them.

\definesynonyms[Function][\FunctionName][\FunctionNumber]

We could define some functions like:

\Function [0001] {0001a} {Lithographer}
\Function [0002] {0002x} {Typesetter}

Than we can recall number and name by \FunctionName (Lithographer and Typesetter) and \FunctionNumber (0001a and 0002x), so:

The $FunctionName{0001}$ has functionnumber $FunctionNumber{0001}$.

M	• •	M

9.3 Sorting

Another instance of lists with synonyms is the sorted list. A sorted list is defined with:

\definesorting[.1.][.2.][.3.] .1. .2. plural name

.3. command

The list is set up with:

```
\setupsorting[...][...,.=...]
            name
. . .
before
            command
after
            command
command
             \command#1
            <u>start</u> stop
state
criterium
            all <u>used</u>
            normal bold slanted boldslanted type cap small... command
style
expansion
           yes command no
```

After the definition the next command is available. The *sort* indicates the name for the list you defined.

\sort[.1.]{.2.}
.1. text
.2. text

In accordance to lists there are two other commands available:

\placelistof*sorts*

The title can be set up with \setuphead:

\completelistof*sorts*

An example of sorting is:

9.1	Table of contents	183
9.2	Synonyms	196
9.3	Sorting	199
9.4	Marking	201
9.5	Cross references	204
9.6	Predefined references	211
9.7	Registers	211

м	•	M

\definesorting[city][cities]
\setupsorting[city][criterium=all]

\city {London}
\city {Berlin}
\city {New York}
\city {Paris}

\city {Hasselt}

\placelistofcities

The definition is typed in the setup area of your file or in an environment file. The cities can be typed anywhere in your text and the list can be recalled anywhere.

Berlin Hasselt

London

New York

Paris

Another instance of the sorting command is that where we must type the literal text of the synonym in order to be able to sort the list. For example if you want a sorted list of commands you should use that instance. The predefined command \logo is an example of such a list.

\logo [TEX] {\TeX}
\logo [TABLE] {\TaBlE}

When you use the alternative with the [] $ConT_EXT$ automatically defines a command that is available throughout your document. In the example above we have \TABLE and \TEX for recalling the logo. For punctuation we use \TABLE.

We advise you to use capital letters to prevent interference with existing ConTEXT and/or TEX commands.

Like in synonyms, a sorted list is only available after an entry is used. When sorting leads to any problems you can load the list yourself:

 $\label{eq:loadsorts}$

When we add a command in the third argument during the definition of the sorted list we may recall sorted list with this command. In this way the sorted lists can not interfere with existing commands (see section 9.2).

search	go back	exit
м	• •	H

9.4 Marking

There is a feature to add 'invisible' marks to your text that can be used at a later stage. Marks can be used to place chapter or section titles in page headers or footers.

A mark is defined with:

```
\definemarking[.1.][.2.]
.1. name
.2. name
```

The second optional argument will be discussed at the end of this section. After the definition texts can be marked by:

```
\marking[.1.]{.2.}
```

- .1. name
- .2. text

and recalled by:

```
\getmarking[.1.][.2.]
```

- .1. name
- .2. first last previous both all current

In analogy with the T_EX -command \mark, we keep record of three other marks per mark (see table 9.2).

When you use a combination of marks (both and all) marks are separated by an -. This separator can be set up with:

```
\setupmarking[...][..=.]
... name
state start stop
separator command
expansion yes no
```

The use of marks can be blocked with the parameter state. The parameter expansion relates to the expansion mechanism. By default expansion is inactive. This means that a command

first	the first of the actual page
last	the last of the actual page
both	first — last
all	previous — first — last

Table 9.2 Recorded marks, completed withsome combinations.

is stored as a command. This suits most situations and is memory effective. When you use altering commands in the mark you should activate the expansion mechanism.

Marks are initialised by:

```
\resetmarking[...]
```

At the beginning of a chapter the marks of sections, subsections, etc. are reset. If we do not reset those marks would be active up to the next section or subsection.

Assume that a word list is defined as follows (we enforce some pagebreaks on purpose):

```
\definemarking[words]
```

```
\marking[words]{first}first word ...
\marking[words]{second}second word ...
\page
\marking[words]{third}third word ...
\page
\marking[words]{fourth}fourth word ...
\page
```

The results are shown in table 9.3.

203

content commands index macros

page	previous	first	last
1	_	first	second
2	second	third	fourth
3	fourth	fifth	fifth

Table 9.3The reordering of marks.

While generating the title of chapters and sections first is used. The content of the marks can be checked easily by placing the mark in a footer:

\setupfootertexts

```
[{\getmarking[words][first]}]
[]
```

or all at once:

```
\setupfootertexts
```

```
[{\getmarking[words][previous]} --
{\getmarking[words][first]} --
{\getmarking[words][last]}]
[]
```

A more convenient way of achieving this goal, is the following command. The next method also takes care of empty markings.

```
\setupfootertexts[{\getmarking[words][all]}][]
```

Commands like \chapter generate marks automatically. When the title is too long you can use the command \nomarking (see section 8.2) or pose limits to the length. In $ConT_EXT$ the standard method to place marks in footers is:

```
\setupfootertexts[chapter][sectionnumber]
```

In case you defined your own title with \definehead, the new title inherits the mark from the existing title. For example when we define \category as follows:

```
\definehead[category][subsection]
```

After this command it does not matter whether we recall the mark by category or subsection. In this way we can also set up the footer:

```
\setupfootertexts[chapter][category]
```

9.1	Table of contents	183
9.2	Synonyms	196
9.3	Sorting	199
9.4	Marking	201
9.5	Cross references	204
9.6	Predefined references	211
9.7	Registers	211

search	go back	exit
м	•	M

There are situations where you really want a separate mark mechanism **category**. We could define such a mark with:

\definemarking[category]

However, we do want to reset marks so we have to have some information on the level at which the mark is active. The complete series of commands would look something like this:

```
\definehead[category][subsection]
```

```
\ensuremath{\mathsf{definemarking}}[category]
```

```
\couplemarking[category][subsection]
```

Note that we do this only when we both use category and subsection! After these commands it is possible to say:

\setupfootertexts[subsection][category]

The command \couplemarking is formally defined as:

```
\couplemarking[.1.][.2.]
```

.1. name .2. name

Its counterpart is:

```
\decouplemarking[...]
```

... name

It is obvious that you can couple marks any way you want, but it does require some insight in the ways $ConT_{F}XT$ works.

9.5 Cross references

We can add reference points to our text for cross referencing. For example we can add reference points at chapter titles, section titles, figures and tables. These reference points are typed between []. It is even allowed to type a list of reference points separated by a comma. We refer to these reference points with the commands:

\in{.1.}{.2.}[*ref*] .1. *text*

9.1	Table of contents	183
9.2	Synonyms	196
9.3	Sorting	199
9.4	Marking	201
9.5	Cross references	204
9.6	Predefined references	211
9.7	Registers	211

\at{.1.}{.2.}[<i>ref</i>] .1. text	•	•	-
[ref] text	•	•	-

A cross reference to a page, text (number) or both can be made with:

\pagereference[*ref*]

\textreference[ref]{...}

... text

```
\reference[ref]{...}
```

... text

The command \in provides the number of a chapter, section, figure, table, etc. The command \at produces a pagenumber and \about produces a complete title. In the first two calls, the second argument is optional, and when given, is put after the number or title.

In the example below we refer to sections and pages that possess reference points:

In section `\in[cross references], titled \about[cross references], we describe how a cross reference can be defined. This section starts at page `\at[cross references] and is part of chapter `\in[references].

This becomes:

In section 9.5, titled "Cross references", we describe how a cross reference can be defined. This section starts at page 204 and is part of chapter 9.

Here is another variation of the same idea:

In \in{section}[cross references], titled \about[cross references], we
describe how a cross reference can be defined. This section starts
at \at{page}[cross references] and is part of \in{chapter}[references].

	6

9.5 Cross references 20)4
9.6 Predefined references 21	.1
9.7 Registers 21	1

search	go back	exit
м	•	

We prefer this way of typing the cross references, especially in interactive documents. The clickable area is in this case not limited to the number, but also includes the preceding word, which is more convenient, especially when the numbering is disabled. In the first example you would have obtained a symbol like⁴ that is clickable. This symbol indicates the direction of the cross reference: forward[▶] or backward⁴.

The direction of a hyperlink can also be summoned by the command \somewhere. In this way we find chapters or other text elements before and discuss somewhere later the descriptions.

```
\somewhere{.1.}{.2.}[ref]
.1. text
```

This command gets two texts. The paragraph will be typed like this:

The direction of a hyperlink can also be summoned by the command \type {\somewhere}. In this way we find chapters or other text elements \somewhere {before} {after} [text elements] and discuss somewhere \somewhere {previous} {later} [descriptions] the descriptions.

The next command does not need any text but will generate it itself. The generated texts can be defined with \setuplabeltext (see page 160).

\atpage	[ref]
---------	-------

At the locations where we make reference points we can also type a complete list of reference points in a comma delimited list:

```
\chapter[first, second, third] {First, second and third}
```

Now you can cross reference to this chapter with \in[first], \in[second] or \in[third]. In a large document it is difficult to avoid the duplication of labels. Therefore it is advisable to bring some order to your reference point definitions. For example, in this manual we use: [fig:first], [int:first], [tab:first] etc. for figures, intermezzos and tables respectively.

 $ConT_EXT$ can do this for you automatically. Using the command \setupreferencing, you can set for instance prefix=alfa, in which case all references will be preceded by the word alfa. A more memory efficient approach would be to let $ConT_EXT$ generate a prefix itself: prefix=+. Prefixing can be stopped with prefix=-.

9.6	Predefined references	211
9.7	Registers	211

search	go back	exit
M	•	M

In many cases, changing the prefix in many places in the document is not an example of clearness and beauty. For that reason, $CONT_EXT$ is able to set the prefix automatically for each section. When for instance you want a new prefix at the start of each new chapter, you can use the command \setuphead to set the parameter prefix to +. The chapter reference itself is not prefixed, so you can refer to them in a natural way. The references within that chapter are automatically prefixed, and thereby local. When a chapter reference if given, this one is used as prefix, otherwise a number is used. Say that we have defined:

\setuphead[chapter][prefix=+]

 $\ \fill the world of \TeX \$

In this chapter, we can safely use references, without the danger of clashing with references in other chapters. If we have a figure:

 $\rho = [fig:worldmap] A map of the TeX world ... \}$

In the chapter itself we can refer to this figure with:

\in {figure} [fig:worldmap]

but from another chapter, we should use:

\in {figure} [texworld:fig:worldmap]

In general, when $ConT_EXT$ tries to resolve a reference in \in, \at etc., it first looks to see whether it is a local reference (with prefix). If such a reference is not available, $ConT_EXT$ will look for a global reference (without prefix). If you have some trouble understanding the mechanism during document production you can visualize the reference with the command \version[temporary].

There are situations where you want to make a global reference in the middle of document. For example when you want to refer to a table of contents or a register. In that case you can type -: in the reference point label that *no* prefix is needed: you type [-:content]. Especially in interactive documents the prefix-mechanism is of use, since it enables you to have documents with thousands of references, with little danger for clashes. In the previous example, we would have got a global reference by saying:

\placefigure[here][-:fig:worldmap]{A map of the \TeX\ world}{...}

The generation of references can be started, stopped and influenced with the command:

9.1	Table of contents	183
9.2	Synonyms	196

	\setupreferencing[,=,]		
	<pre>state sectionnumber prefix interaction width left right convertfile separator autofile global</pre>	<pre>start stop yes no + - text label text all symbol dimension command command yes no small big text yes no page yes no</pre>	
l			

In this command the parameter *section*number relates to the way the page numbers must be displayed. In interactive documents, we can refer to other documents. In that case, when the parameter convertfile is set to yes, external filenames are automatically converted to uppercase, which is sometimes needed for CDROM distributions. We will go into details later.

References from another document can be loaded with the command:

```
\usereferences[..,...]
... file
```

With left and right you can define what is written around a reference generated by \about. Default these are quotes. The parameter interaction indicates whether you want references to be displayed like *section 1.2, section, 1.2* or as a symbol, like \blacksquare .

What exactly is a cross reference? Earlier we saw that we can define a reference point by typing a logical label at the titles of chapters, sections, figures, etc. Then we can summon the numbers of chapters, sections, figures, etc. or even complete titles at another location in the document. For some internal purposes the real pagenumber is also available. In the background real pagenumbers play an important role in the reference mechanism.

In the examples below we discuss in detail how the reference point definitions and cross referencing works in $ConT_{F}XT$.

\reference[my reference]{{Look}{at}{this}}

The separate elements can be recalled by $\ref:$

9.1	Table of contents	183
9.2	Synonyms	196
9.3	Sorting	199
9.4	Marking	201
9.5	Cross references	204
9.6	Predefined references	211
9.7	Registers	211

м	•	M

- p the typeset pagenumber \ref[p][my reference] 208
- t the text reference \ref[t][my reference] Look
- r the real pagenumber \ref[r][my reference] 211
- s the subtext reference \ref[s][my reference] at
- e the extra text reference \ref[e][my reference] this

In a paper document the reference is static: a number or a text. In an interactive document a reference may carry functionality like hyperlinks. In addition to the commands \in and \at that we discussed earlier we have the command \goto, which allows us to jump. This command does not generate a number or a text because this has no meaning in a paper version.

 $ConT_EXT$ supports interactivity which is integrated into the reference mechanism. This integration saved us the trouble of programming a complete new set of interactivity commands and the user learns how to cope with these non-paper features in a natural way. In fact there is no fundamental difference in referring to chapter 3, the activation of a JAVASCRIPT, referring to another document or the submitting of a completed form.

A direct advantage of this integration is the fact that we are not bound to one reference, but we can define complete lists of references. This next reference is legal:

```
... see \in{section}[flywheel,StartVideo{flywheel 1}] ...
```

As expected this command generates a section number. And in an interactive document you can click on *section nr* and jump to the correct location. At the moment that location is reached a video titled *flywheel 1* is started. In order to reach this kind of comfortable referencing we cannot escape a fully integrated reference mechanism.

Assume that you want to make a cross reference for a general purpose. The name of the reference point is not known yet. In the next example we want to start a video from a general purpose menu:

\startinteractionmenu[right]

\but	[previouspage]	previous	$\setminus \setminus$
\but	[nextpage]	next	$\setminus \setminus$
\but	[ShowAVideo]	video	$\setminus \setminus$
\but	[CloseDocument]	stop	$\setminus \setminus$

\stopinteractionmenu

Now we can activate a video at any given moment by defining ShowAVideo:

\definerreference[ShowAVideo][StartVideo{a real nice video reel}]

This reference can be redefined or erased at any moment:

\definereference[ShowAVideo][]

\definereference[...][*ref*,..]

... name

\startlinenumbering

A special case of referencing is that of referring to linenumbers. \startline [line:a] Different line numbering mechanism can be used interchangeably. \startline [line:b] This leads to confusing input. \stopline [line:a] \startline [line:c] Doesn't it? \stopline [line:c] \stopline [line:b] A cross reference to a line can result in one line number or a range of lines. \someline[line:d] {A cross reference is specified by \type {\inline} where the word {\em line(s)} is automatically added.} Here we have three cross references: \inline [line:a], \inline [line:b], \inline[line:c] and \inline {as the last reference} [line:d]. \stoplinenumbering

\stoplinenumbering

With startlines..stoplines you will obtain the range of lines in a cross reference and in case of someline you will get the first line number. In this example we see that we can either let ConT_EXT generate a label automatically, or privide our own text between braces.

A special case of referencing is that of referring to linenumbers. Different line numbering mechanism can be used interchangeably. This leads to confusing input. Doesn't it? A cross reference to a line can result in one line number or a range of lines. **Manual mapped mapped d lines differenc**[line:d] A cross reference is specified by \inline where the word *line(s)* is automatically added. Here we have three cross references: line 1–2, line 2, line 2 and as the last reference ??.

211

9.6 Predefined references

One can imagine that it can be cumbersome and even dangerous for consistency when one has many references which the same label, like **figure** in \in{figure}[somefig]. For example, you may want to change each **figure** into Figure afterwards. The next command can both save time and force consistency:

\definereferenceformat[...][..,.=..,.]
... name
left text
right text

text text label name

Given the following definitions:

```
\definereferenceformat [indemo] [left=(,right=),text=demo]
\definereferenceformat [indemos] [left=(,right=),text=demos]
\definereferenceformat [anddemo] [left=(,right=),text=and]
```

we will have three new commands:

```
\indemo [demo:b]
```

\indemo {some text} [demo:b]

\indemos {some text} [demo:b] \indemo {and more text} [demo:c]

\indemos [demo:b] \anddemo [demo:c]

These will show up as:

demo (BB) some text (BB) some text (BB) and more text (CC) demos (BB) and (CC)

Instead of using the text parameter, one can use label and recall a predefined label. The parameter command can be used to specify the command to use (\in by default).

9.7 Registers

A book without a register is not likely to be taken seriously. Therefore we can define and generate one or more registers in $CONT_EXT$. The index entries are written to a separate file. The PERL script T_EXUTIL converts this file into a format T_EX can typeset.

Table of contents

9.1

- 9.5 Cross references 204
- 9.6 Predefined references 211
- 9.7 Registers

A register is defined with the command:

```
\defineregister[.1.][.2.]
.1.
```

.2. plural name

There are a number of commands to create register entries and to place registers. One register is available by default:

```
\defineregister[index][indices]
```

An entry is created by:

```
\register[.1.]{..+.2.+..}
.1. text
.2. text
```

An entry has a maximum of three levels. The subentries are separated by a + or **&**. We illustrate this with an example.

```
\index{car}
\index{car+wheel}
\index{car+engine}
```

When index entries require special typesetting, for example \sl and \kap we have to take some measures, because these kind of commands are ignored during list generation and sorting. In those cases we can use the extended version. Between [] we type the literal ASCII-string which will determine the alphabetical order.

For example we have defined logos or abbreviations like UN, UK and USA (see section 9.2), then an index entry must look like this:

```
\index[UN]{\UN}
\index[UK]{\UK}
\index[USA]{\USA}
```

If we do not do it this way UN, UK and USA will be placed under the $\$.

A cross reference within a register is created with:

M		•			M

▶ ◀

```
\seeregister[.1.]{.2.}{..+.3.+..}
```

```
.1. text
```

```
.2. text
```

```
.3. text
```

This command has an extended version also with which we can input a 'pure' literal ASCII string.

A register is generated and placed in your document with:

```
\placeregister[..,..=..,..]
..=.. see p 214: \setupregister
```

The next command results in register with title:

```
\completeregister[...,..=...]
...=.. see p 214: \setupregister
```

The register can be set up with the command \setupregister. When you use the command \version[temporary] during processing, the entries and their locations will appear in the margin (see section ??).

distance	dimension		
symbol	12 n a none		
interaction	pagenumber text		
expansion	yes command <u>no</u>		
referencing	<u>on</u> off		
command	\command#1		
location	left <u>middle</u> right		
maxwidth	dimension		
unknownreference	<u>empty</u> none		

By default a complete register is generated. However it is possible te generate partial registers. In that case the parameter criterium must be set. With indicator we indicate that we want a letter in the alphabetical ordering of the entries. When referencing=on is a pagereference is generated for every letter indicator, for example index:a or index:w. We can use these automatically generated references to refer to the page where for instance the a-entries start.

The commands we have mentioned thus far allow us to use a spacious layout in our source file. This means we can type the entries like this:

```
\chapter{Here we are}
```

```
\section{Where we are}
\index{here}
\index{where}
```

```
Wherever you are ...
```

Between \chapter and \section we should not type any text because the vertical spacing might be disturbed by the index entries. The empty line after the entry has no consequences.

9.1	Table of contents	183
9.2	Synonyms	196
9.3	Sorting	199
9.4	Marking	201
9.5	Cross references	204
9.6	Predefined references	211
9.7	Registers	211

In case there are problems we always have the option to write index entries to the list by the more direct command:

[setup writetoregister* is undefined]

There the expansion mechanism can be activated. Default expansion is inactive (see page 201).

In this reference manual there is a register with commands. This register is defined and initialised with:

```
\defineregister [macro] [macros]
\setupregister [macro] [indicator=no]
```

And we can find entries like:

```
\macro{\tex{chapter}}
\macro{\tex{section}}
```

In case we want a register per chapter we can summon the accompanying register with the command below (the command \tex will place a $\$ in front of a word, but is ignored during sorting):²¹

```
\placeregister[macro]
```

```
[criterium=chapter,n=2,before=,after=]
```

and we will obtain:

A warning is due. The quality of the content of a register is completely in your hands. A bad selection of index entries leads to an inadequate register that is of no use to the reader.

Every entry shows one or more pagenumbers. With symbol we can define some alternatives. With distance the horizontal spacing between word and number or symbol is set.

9.1

search	go back	exit
M	•	

²¹ Of course, \placemacro and \completemacros are also available.

Most of the time the layout of a register is rather simple. Some manuals may need some form of differentiating between entries. The definition of several registers may be a solution. However the layout can contribute to a better use of the register:

\index	{entry}
\index[key]	{entry}
\index[form::]	{entry}
<pre>\index[form::key]</pre>	{entry}
\index	<pre>{form::entry}</pre>
\index[key]	<pre>{form::entry}</pre>
\index[form::]	<pre>{form::entry}</pre>
<pre>\index[form::key]</pre>	<pre>{form::entry}</pre>

The first two alternatives are known, but the rest is new and offers some control over the way the entry itself is typeset. The specification between [] relates to the pagenumber, the specification in front of the entry relates to the entry itself.

\setupregister[index][form][pagestyle=bold,textstyle=slanted]

Without any problems we can use different appearances for pagenumber and entry.

```
\setupregister[index][nb][pagestyle=bold]
\setupregister[index][hm][pagestyle=slanted]
```

With for example:

```
\index[nb::]{squareroot}
\index[hm::root]{$\srqt{2}$}
```

The index entries we have discussed so far indicate the one page where the entry is made, but we can also indicate complete ranges of pages using:

```
[setup start*register is undefined]
```

The entries in between, which are of the same order, are not placed in the register.

```
\startregister[endless]{endless}
```

..... an endless story
\stopregister[endless]

An extensive index entry, i.e. an entry with a large number of appearances, may have an uncomfortably long list of pagenumbers. Especially in interactive documents this leads to endless back and forth clicking. For this purpose we designed the feature of linked index entries. This means that you can couple identical entries into a list that enables the user to

9.7	Registers	211

9

jump from entry to (identical) entry without returning to the register. The coupling mechanism is activated by:

```
\setupregister[index][coupling=yes]
```

In this way a mechanism is activated that places references in the register $(\triangleleft \bowtie \triangleright)$ as well as in the text $(\triangleleft word \triangleright)$ depending on the availability of alternatives. A jump from the register will bring you to the first, the middle or the last appearance of the entry.

This mechanism is only working at the first level; subentries are ignored. Clicking on the word itself will bring you back to the register. Because we need the clickable word in the text we use the following command for the index entry itself:

```
\coupledregister[.1.]{.2.}
.1. text
.2. text
```

For example \coupledindex{where}. The couplings must be loaded with the command:

```
\coupleregister[...]
```

... name

Normally this command is executed automatically when needed, so it's only needed in emergencies.

Registers

Descriptions

10.1 Introduction

In a document we can find text elements that bring structure to a document. We have already seen the numbered chapter and section titles, but there are more elements with a recognizable layout. We can think of numbered and non-numbered definitions, itemizations and citations. One of the advantages of T_EX and therefore of CONT_EXT is that coding these elements enables us to guarantee a consistent design in our document, which in turn allows us to concentrate on the content of our writing.

In this chapter we will discuss some of the elements that will bring structure to your text. We advise you to experiment with the commands and their setups. When applied correctly you will notice that layout commands in your text are seldom necessary.

10.2 Definitions

Definitions of concepts and/or ideas, that are to be typeset in a distinctive way, can be defined by \definedescription.

```
\definedescription[...][..,.=..,.]
```

```
... name
...=.. see p 221: \setupdescriptions
```

The first argument of this command contains the name. After the definition a new command is available.

```
\description{.1.}.2.\par
```

```
.1. text
.2. text
```

An example of the definition is:

\definedescription[definition][location=top,headstyle=bold]

\definition{icon}

An icon is a representation of an action or the name of a computer program. Icons are frequently used in operating systems on several computer platforms. \par

Several alternatives are displayed below:

icon

An icon is a representation of an action or the name of a computer program. Icons are frequently used in operating systems on several computer platforms.

Some users of those computer platforms are using these icons with an almost **icon** religious fanaticism. This brings the word icon almost back to its original meaning.

- icon An icon should be recognizable for every user but they are designed within a cultural and historical setting. In this fast and ever changing era the recognizability of icons is relative.
- **icon** The 8-bit principle of computers was the reason that non-Latin scriptures were hardly supported by the operating systems. Not long ago this changed.

icon What for some languages looked like a handicap has now become a feature. Thousands of words and concepts are already layed down in characters. These characters therefore can be considered icons.

icon It is to be expected that people with expressive languages overtake us in computer usage because they are used to thinking in concepts.

icon The not-so-young generation remembers the trashcan in the earlier operating systems used to delete files. We in Holland were lucky that the text beneath it said: trashcan. A specific character for the trashcan would have been less sensitive misinterpretation, than the rather American-looking garbage receptacle unknown to many young people.

In the fifth example the definition is placed **serried** and defined as:

 \definedescription

[definition] [location=serried,headstyle=bold,width=broad,sample={icon}]

\definition{icon}

What for some languages looked like a handicap has now become a feature. Thousands of words and concepts are already layed down in characters. These characters therefore can be considered icons. \par

Definitions

In the seventh example we have set hang at broad. This parameter makes only sense when we set the label at the right or left. When we set width at fit or broad instead of a number, the width of the sample is used. With fit, no space is added, with broad, a space of distance is inserted. When no sample is given the with of the defined word is used. The parameter align specifies in what way the text is aligned. When the definition is placed in the margin or typeset in a serried format, the parameter margin is of importance. When set to standard or ja, the marging follows the document setting. Alternatively you can pass a dimension.

Some characteristics of the description can be specified with:

\setupdes	criptions[,,][,=,]
headstyle style color width distance sample text align	name normal bold slanted boldslanted type cap small command normal bold slanted boldslanted type cap small command name fit broad dimension dimension text text left middle right
margin location hang before inbetween after indentnext	standard yes no <i>dimension</i> <u>left</u> right top serried inmargin inleft inright hanging fit broad <i>number</i> <i>command</i> <i>command</i> <i>command</i> <u>yes</u> no

The setup of a description can be changed with the command below. This has the same construct as \definedescription:

\setupdescriptions[*name*][*setups*]

When a description consists of more than one paragraph, use:

```
\verb|startdescription{...}| ... \verb|stopdescription||
```

... text

\startdefinition{icon}

Definitions

An icon is a painting of Jesus Christ, Mother Mary or other holy figures. These paintings may have a special meaning for some religious people.

For one reason or the other the description icon found its way to the computer world where it leads its own life.

\stopdefinition

These commands will handle empty lines adequately.

10.3 Enumeration

Sometimes you will encounter text elements you would like to number, but they do not fit into the category of figures, tables, etc. Therefore $CONT_EXT$ has a numbering mechanism that we use for numbering text elements like questions, remarks, examples, etc. Such a text element is defined with:

```
\ensuremath{\mathsf{defineenumeration}[...,1.,..][.2.][...,.=...]
```

```
.1. name
```

```
.2. name
..=.. see p 224: \setupenumerations
```

After such a definition, the following commands are available:

 \name

\sub*name*

\subsub*name*

\subsubsub*name*

Where name stands for any chosen name.

∖enum	eration\par	•	
	text		

The numbering can take place at four levels. Conversion is related to the last level. If you specify a text, then this will be a label that preceeds every generated number. A number can be set and reset with the command:

\setenumeration{value}
\resetenumeration

content	commands	
index	macros

10.7	Items	239
10.8	Citations	240

search	go back	exit
M		M

10

You can use the start parameter in the setup command to explicitly state a startnumber. Keep in mind that the enumeration commands increase the number, so to start at 4, one must set the number at 3. Numbers and subnumbers and be explicitly increased with the commands:

- \nextenumeration
 \nextsubenumeration
- \nextsubsubenumeration

The example below illustrates the use of $\ensuremath{\mbox{enumeration}}$. After the shown commands the content of a remark can be typed after \mbox{remark} .

 $\define enumeration$

[remark]
[location=top,
 text=Remark,
 between=\blank,
 before=\blank,
 after=\blank]

Some examples of remarks are:

Remark 1

After definition the 'remark' is available at four levels: \remark, \subremark, \subsubremark and \subsubremark.

Remark 2

This command looks much like the command \definedescription.

The characteristics of numbering are specified with \setupenumerations. Many parameters are like that of the descriptions because numbering is a special case of descriptions.

\setupenumerations[name][setups]

10.1 10.2	Introduction Definitions	219 219
10.3 10.4	Enumeration Indenting	222 226

blockway	<u>yes</u> no
sectionnumber	yes number no
separator	text
stopper	text
coupling	name
couplingway	global <u>local</u>
number	no name
aligntitle	no <u>yes</u>
start	number

The characteristics of sub and subsub enumerations can be set too. For example:

```
\setupenumerations[example][headstyle=bold]
```

\setupenumerations[subexample][headstyle=slanted]

Just like the description command there is a \start-\stop construction for multi paragraph typesetting.

```
\startenumeration ... \stopenumeration
```

Sometimes the number is obsolete. For example when we number per chapter and we have only *one* example in a specific chapter. In that case you can indicate with a [-] that you want no number to be displayed.

Remark

Because this remark was recalled by \remark[-] there is *no* number. Just as with other commands, we can also pass a reference label between []. Also, we can setup the enumeration to stop numbering by setting number to no.

The numbering command can be combined usefully with the feature to move textblocks. An example is given in section 12.4. In that example we also demonstrate how to couple one numbered text to another. These couplings only have a meaning in interactive documents where cross references (hyperlinks) can be useful.

search	go back	exit
м	•	M

The numbering of text elements can appear in different forms. In that case we can let one numbered text element inherit its characteristic from another. We illustrate this in an example.

\defineenumeration[first]

\first The numbering \type {first} is unique. We see that one argument is sufficient. By default label and number are placed at the left hand side.

```
\defineenumeration[second][first][location=right]
```

\second The \type {second} inherits its counters from \type {first},
but is placed at the right hand side. In case of three arguments the first
one is the copy and the second the original.

```
\doornummeren[third,fourth][location=inright]
```

 $\$ third The numbered elements $\$ and $\$ and $\$ placed in right margin.

fourth Both are defined in one command but they do have own counters that are in no way coupled.

\doornummeren[fifth,sixth][first]

 $fifth The elements \type {fifth} and \type {sixth} inherit the properties and counters of \type {first}.$

 $\times the second and the second are second as allowed because type {second} is not an original! \\ par$

It may seem very complex but the text below may shed some light on this issue:

first 1

The numbering first is unique. We see that one argument is sufficient. By default label and number are placed at the left hand side.

The second inherits its counters from first, but is placed at the right hand side. In case of three arguments the first one is the copy and the second the original.

The numbered elements third and fourth are both unique and are placed in right margin. third 1

Both are defined in one command but they do have own counters that are in no way coupled. **fourth 1**

10.1	Introduction	219

search	go back	exit
H	•	M

fifth 3

The elements fifth and sixth inherit the properties and counters of first.

sixth 4

Note: inheriting of second is not allowed because second is not an original!

It is possible to couple a numbered text element to another. For example we may couple questions and answers. In an interactive document we can click on a question which will result in a jump to the answer. And vice versa. The counters must be synchronised. Be aware of the fact that the counters need some resetting now and then. For example at the beginning of each new chapter. This can be automated by setting the parameter way to bychapter.

\definedescription [question] [coupling=answer]
\definedescription [answer] [coupling=question]

10.4 Indenting

Indented itemizations, like dialogues, can be typeset with the command defined by

```
\defineindenting[...][...,.=..,.]
... name
...=.. see p 227: \setupindentations
```

After this command \name, \subname and \subsubname are available.

```
\ indentation...\ par
```

... text

The parameters can be set up with the command:

10.1	Introduction	219
10.2	Definitions	219
10.3	Enumeration	222
10.4	Indenting	226
10.5	Numbered labels	228
10.6	Itemize	229
10.7	Items	239
10.8	Citations	240

Descriptions

```
\setupindentations[..,...][..,.=..,.]
```

	name
style	normal bold slanted boldslanted type cap small command
headstyle	normal bold slanted boldslanted type cap small command
width	fit dimension
text	text
sample	text
before	command
after	command
distance	dimension
separator	text

It is possible to change the setup of **\indentation** with the command:

\setupindentations[name][setups]

An example of how you can use the indentation mechanism is given below:

\setupindentations

```
[sample={rime m},
separator={:},
distance=.5em]
```

```
\defineindenting[ra][text=rime a]
\defineindenting[rb][text=rime b]
\defineindenting[rc][text=rime c]
```

\startpacked

```
\ra pretty litte girl
```

```
\ \ pretty litte girl in a blue dress
```

```
\rb pretty little girl in a blue dress
```

- rb make my day
- $\ c\$ smile for me
- \stoppacked

This results in:

rime a : pretty litte girl
rime a : pretty litte girl in a blue dress
rime b : pretty little girl in a blue dress
rime c : playing in the sand

10.1	Introduction	219

10.7	Items	239
10.8	Citations	240

Descriptions

228

rime b : make my day

rime c : smile for me

A series of indenting commands can be enclosed with the commands:

startindentation

 \stopindentation

10.5 Numbered labels

There is another numbering mechanism that is used for numbering specific text labels that also enables you to refer to these labels. For example, when you want to refer in your text to a number of transparencies that you use in presentations the next command can be used:

$\det[\ldots][\ldots]\ldots$			
<pre>text location way blockway headstyle headcolor before</pre>	name text inmargin <u>intext</u> bytext bysection <u>bychapter</u> <u>yes</u> no normal bold slanted boldslanted type cap small command name command		
after	command		

Where the parameter location is set at intext and inmargin. After this definition the following commands are available:

\reset*name*

\increment*name*

\next*name*

\current*name*[reference]

The [reference] after currentname is optional. After

\definelabel[video][text=video,location=inmargin]

video 10.1This defines \video, that results in a numbered label *video* in the margin. The command
\currentvideo would have resulted in the number 0. The label can also be recalled with:

\labeling[ref]

10.1	Introduction	219
10.2	Definitions	219
10.3	Enumeration	222
10.4	Indenting	226
10.5	Numbered labels	228
10.6	Itemize	229
10.7	Items	239
10.8	Citations	240

search	go back	exit
M	•	м

In our case, saying \video results in the marginal note concerning a video. The values of before and after are executed around the label (which only makes sense for in-text labels.

10.6 Itemize

Items in an itemization are automatically preceded by symbols or by enumerated numbers or characters. The symbols and the enumeration can be set up (see table 10.1). The layout can also be influenced. Itemization has a maximum of four levels.

setup	result	setup	result
n	1, 2, 3, 4	1	dot (•)
a	a, b, c, d	2	dash (–)
A	A, B, C, D	3	star (*)
КА	A, B, C, D	4	triangle (⊳)
r	i, ii, iii, iv	5	circle (°)
R	I, II, III, IV	6	big circle (\bigcirc)
KR	I, II, III, IV	7	bigger circle (\bigcirc)
m	1, 2, 3, 4	8	square (□)
g	α, β, γ		
G	А, В, Г		

Table 10.1Item separator identifications in itemiza-tions.

The command to itemize is:

\startitemize[*setups*]

\item

\item

\stopitemize

So you can do things like this:

Which of these theses are true?

\startitemize[A]

 $\$ The difference between a village and a city is the existence of

content commands index macros

searc	h	go	back	exit
' -			++	- ++
M		•		M

a townhall.

\item The difference between a village and a city is the existence of a courthouse.

\stopitemize

This will lead to:

Which of these theses are true?

A. The difference between a village and a city is the existence of a townhall.

B. The difference between a village and a city is the existence of a courthouse.

The symbols used under 1 to 8 can be defined with the command \definesymbol (see section ??) and the conversion of the numbering with \defineconversion (see section ??). For example:

Do the following propositions hold some truth?

\definesymbol[1][\$\diamond\$]

\startitemize[1]

\item The city of Amsterdam is built on wooden poles.

\item The city of Rome was built in one day.

\stopitemize

results in:

Do the following propositions hold some truth?

♦ The city of Amsterdam is built on wooden poles.

 $\diamond~$ The city of Rome was built in one day.

The keys n, a, etc. are related to the conversions. This means that all conversions are accepted. Take for example:

 α . a g for Greek characters

 β . a **G** for Greek capitals

When the setup and the [] are left out then the default symbol is typeset.

The indentation and horizontal whitespace is set up locally or globally with:

10.1 10.2 10.3	Introduction Definitions Enumeration Indenting	219 219 222 226
10.4 10.5 10.6 10.7	Numbered labels Itemize Items	228 229 239
10.8	Citations	240

\setupitemize	[.1.]	[2.,][,	=]
(L J	L , -	,	<u>_</u> ,	

	.1.	number each
	.2.	<pre>standard n*broad n*serried packed unpacked stopper joinedup atmargin inmargin</pre>
		autointro loose section intext
	margin	no standard dimension
	width	dimension
	distance	dimension
	factor	number
	items	number
	start	number
	before	command
	inbetween	command
	after	command
	left	text
	right	text
	beforehead	command
	afterhead	command
	headstyle	normal bold slanted boldslanted type cap small command
	marstyle	normal bold slanted boldslanted type cap small command
	symstyle	normal bold slanted boldslanted type cap small command
	stopper	text
	n	number
	symbol	number
	align	left right <u>normal</u>
	indentnext	<u>yes</u> no
Ľ		

These arguments may appear in different combinations, like:

What proposition is true?

```
\startitemize[a,packed][stopper=:]
```

```
\item 2000 is a leap-year
\item 2001 is a leap-year
```

```
\item 2002 is a leap-year
```

```
\item 2003 is a leap-year
```

\stopitemize

this will become:

What proposition is true?

a: 2000 is a leap-year

b: 2001 is a leap-year

10.1	Introduction	219
10.2	Definitions	219
10.3	Enumeration	222
10.4	Indenting	226
10.5	Numbered labels	228
10.6	Itemize	229
10.7	Items	239
10.8	Citations	240

search	1	go back	(exit
M			t 1	M

c: 2002 is a leap-year

d: 2003 is a leap-year

Both argument are optional. The key packed is one of the most commonly used:

What proposition is true?

\startitemize[n,packed,inmargin]
\item[ok] 2000 is a leap-year
\item 2001 is a leap-year
\item 2002 is a leap-year
\item 2003 is a leap-year
\stopitemize

will result in:

What proposition is true?

- 1. 2000 is a leap-year
- 2. 2001 is a leap-year
- 3. 2002 is a leap-year
- 4. 2003 is a leap-year

It happens very often that an itemization is preceded by a sentence like "... *can be seen below:*". In that case we add the key intro and the introduction sentence will be 'connected' to the itemization. After this setup a pagebreak between sentence and itemization is discouraged.

\startitemize[n,packed,inmargin,intro]

The setup of the itemization commands are presented in table 10.2.

In the last example we saw a reference point behind the command \item for future cross referencing. In this case we could make a cross reference to answer 1 with the command $\in[ok]$.

The enumeration may be continued by adding the key continue, for example:

\startitemize[continue]
\item 2005 is a leap-year
\stopitemize

This would result in a rather useless addition:

10.1	Introduction	219
10.2	Definitions	219
10.3	Enumeration	222
10.4	Indenting	226
10.5	Numbered labels	228
10.6	Itemize	229
10.7	Items	239
10.8	Citations	240

Descriptions

233

setup	result
standard	default setup
packed	no white space between items
joinedup	no white space before and after itemization
paragraph	no white space before an itemization
<i>n</i> *serried	little horizontal white space after symbol
<i>n</i> *broad	extra horizontal white space after symbol
inmargin	item separator in margin
atmargin	item separator at the margin
stopper	punctuation after item separator
intro	no pagebreak
columns	two columns

Table 10.2Setup of \setupitemize.

5. 2005 is a leap-year

Another example illustrates that continue even works at other levels of itemizations:

- supported image formats in PDFT_EX
 - a. png
 - b. eps
 - c. pdf
- **non supported image formats in** PDFT_EX
 - d. jpg
 - e. gif
 - f. tif

This was typed as (in this document we have set headstyle=bold):

\startitemize[1,packed]

```
\head supported image formats in \PDFTEX \par
   \startitemize[a]
```

```
\item png \item eps \item pdf
```

```
\stopitemize
```

10.2 Definitions 219 10.3 Enumeration 222 10.4 Indenting 226 10.5 Numbered labels 228 10.6 Itemize 229 10.7 Items 239 10.8 Citations 240
--

search	go back	exit
м	•	

\startitemize[continue]
\item jpg \item gif \item tif
\stopitemize

\stopitemize

When we use the key columns the items are typeset in two columns. The number of columns can be set by the keys one, two (default), three or four.

\startitemize[n,columns,four]

\item png \item tif \item jpg \item eps \item pdf
\item gif \item pic \item bmp \item bsd \item jpe
\stopitemize

We can see that we can type the items at our own preference.

1. png	4. eps	7. pic
2. tif	5. pdf	8. bmp
3. jpg	6. gif	9. bsd

In such a long enumerated list the horizontal space between itemseparator and text may be too small. In that case we use the key broad, here 2*broad:

10.jpe

I.	png	IV.	eps	VII.	pic	Х.	jpe
II.	tif	V.	pdf	VIII.	bmp		
III.	jpg	VI.	gif	IX.	bsd		

The counterpart of broad is serried. We can also add a factor. Here we used 2*serried.

•What format is this?

We can abuse the key **broad** for very simple tables. It takes some guessing to reach the right spacing.

This results in a rather strange example:

\startitemize[4*broad,packed]
\sym {yes} this is a nice format
\sym {no} this is very ugly
\stopitemize

yes this is a nice format

no this is very ugly

10.1	Introduction	219
10.2	Definitions	219
10.3	Enumeration	222
10.4	Indenting	226
10.5	Numbered labels	228
10.6	Itemize	229
10.7	Items	239
10.8	Citations	240

The parameter **stopper** expects a character of your own choice. By default it is set at a period. When no level is specified and the [] are empty the actual level is activated. In section ?? we will discuss this in more detail. Stoppers only apply to ordered (numbered) list.

There are itemizations where a one line head is followed by a text block. In that case you use \head instead of \item. You can specify the layout of \head with the command \setupitemize. For example:

\setupitemize[each][headstyle=bold]

\startitemize[n]

\head A title head in an itemization

After the command $type{head}$ an empty line is mandatory. If you leave that out you will get a very long header.

\stopitemize

This becomes:

1. A title head in an itemization

After the command \head an empty line is mandatory. If you leave that out you will get a very long header.

If we would have used \item the head would have been typeset in a normal font. Furthermore a pagebreak could have been introduced between head and textblock. This is not permitted when you use \head.

\head[ref,..]

When an itemization consists of only one item we can leave out the commands \startitemize and \stopitemize and the level 1 symbol is used.

\item The itemization commands force the user into a consistent layout of the itemizations. $\protect\$

Instead of the par you could have used an empty line. In each case, we get the following output:

Itemize

10.1	Introduction	219
10.2	Definitions	219
10.3	Enumeration	222
10.4	Indenting	226
10.5	Numbered labels	228
10.6	Itemize	229
10.7	Items	239
10.8	Citations	240

• The itemization commands force the user into a consistent layout of the itemizations.

Only the text directly following the command and ended by an empty line or \par is indented.

When you want to re-use the last number instead of increasing the next item you can use \sub. This feature is used in discussion documents where earlier versions should not be altered too much for reference purposes.

- 1. This itemization is preceded by \startitemize[n,packed].
- +1. This item is preceded by \sub, the other items by \item.
- 2. The itemization is ended by \stopitemize.

The most important commands are:

\startitemize[...,...][...,.=....] ... \stopitemize

- ... a A KA n N m r R KR *number* continue <u>standard</u> *n**broad *n**serried packed stopper joinedup atmargin inmargin intro columns
- ..=.. see p 231: \setupitemize

\item[ref,..]

\sub[ref,..]

In addition to *\item* there is *\sym*. This command enables us to type an indented text with our own symbol.

 $sym{...}$

Another alternative to \item is \mar. The specified argument is set in the margin (by default a typeletter) and enables us to comment on an item.

\mar[*ref,..*]{...}

Some at first sight rather strange alternatives are:

\its[ref,..]

content	commands
index	macros

10.1	Introduction	219
10.2	Definitions	219
10.3	Enumeration	222
10.4	Indenting	226

10.6	Itemize	229
10.7	Items	239
10.8	Citations	240

search	go back	exit
м	• •	N N

 $ran{...}$

These acronyms are placeholders for *items* and *range*. We illustrate most of these commands with an example that stems from a NTG questionnaire:

no yes I can not do without T_EX. 0 0 0 0 0 I will use T_FX forever. 0 0 0 0 0 I expect an alternative to T_FX in the next few years. 0 0 0 I use T_FX and other packages. 0 0 0 I hardly use T_EX. 0 0 0 I am looking for another system. 0 0 0 0 The source is typed below. Look at the setup, it is local.

The source is typed below. Look at the setup, it is local.

```
\startitemize[5,packed][width=8em,distance=2em,items=5]
```

 $ran {nohss yes}$

\its I can not do without \TeX.

\its I will use TeX forever.

\its I expect an alternative to $\TeX\$ in the next few years.

\its I use $\TeX\$ and other packages.

\its I hardly use TeX.

 $\$ I am looking for another system.

 \stopitemize

For the interactive version there is:

but[ref]

This command resembles \item but produces an interactive symbol that executes the reference sequence specified.

The example below shows a combination of the mentioned commands. We also see the alternative \nop .

$10.1 \\ 10.2$	Introduction Definitions	219 219

Descriptions

238

• he got a head ache

1. of all the items

he had to learn at school

++ 2. because the marginal explanation

+2. of the substantial content

turned out to be mostly symbolic

This list was typed like this:

\startitemize

\head he got a head ache

\startitemize[n,packed]

- \item of all the items
- \nop he had to learn at school
- \mar{++} because the marginal explanation
- \sub of the substantial content
- \sym{\#} turned out to be mostly symbolic
 \stopitemize

\stopitemize

With the no-operation command:

\nop

During the processing of itemizations the number of items is counted. This is the case with all versions. The next pass this information is used to determine the optimal location to start a new page. So do not despair when at the first parse your itemizations do not look the way you expected. When using $T_{F}XEXEC$ this is all taken care of.

We have two last pieces of advises. When items consist of two or more paragraphs always use \head instead of \item, especially when the first paragraph consists only one line. The command \head takes care of adequate pagebreaking between two paragraphs. Also, always use the key [intro] when a one line sentence preceeds the itemization. This can be automated by:

\setupitemize[each][autointro]

10.1	Introduction	219
10.2	Definitions	219
10.3	Enumeration	222
10.4	Indenting	226

K	•	M	

10.7 Items

A rarely used variant of producing lists is the command \items. It is used to produce simple, one level, vertical or horizontal lists. The command in its simplest form looks like this:

```
\items{alternative 1, alternative 2,..., alternative N}
```

Instead of an alternative you can also type –. In that case space is reserved but the item is not set. The layout of such a list is set with the command:

```
\setupitems[..,..=..,..]
```

location	<u>left</u> right inmargin top bottom
symbol	12 n a <i>text</i> none
width	dimension
n	<i>number</i> unknown
before	command
inbetween	command
align	left right <u>middle</u> margin
after	command

The number (n) as well as the width are calculated automatically. When you want to do this yourself you can use the previous command or you pass the options directly. We show some examples.

```
\items[location=left]{png,eps,pdf}
```

10.8 Citations

The use of quotes depends on the language of a country: 'Nederlands', 'English', ,Deutsch', -Français>. The consistent use of single and double quotes is supported by a number of commands. A citation in the running text is typeset by:

```
\startquotation[...,...] ... \stopquotation
      n*left n*middle n*right
. . .
```

This command can be compared with \startnarrower and has the same setup parameters. The quotes are placed around the text and they fall outside the textblock:

search	go back	exit
м	•	M

"In commercial advertising 'experts' are quoted. Not too long ago I saw a commercial where a washing powder was recommended by the Dutch Society of Housewives. The remarkable thing was that there was a spokesman and not a spokeswoman. He was introduced as the "director". It can't be true that the director of the Society of Housewives is a man. Can it? "

In this example we see two other commands:

startquotation

In commercial advertising \quote {experts} are quoted. Not too long ago I saw a commercial where a washing powder was recommended by the Dutch Society of Housewives. The remarkable thing was that there was a spokesman and not a spokeswoman. He was introduced as the \quotation {director}. It can't be true that the director of the Society of Housewives is a man. Can it? \stopquotation

The command \quotation produces double quotes and \quote single quotes.

 $quote{...}$

... text

... text

These commands adapt to the language. In Dutch, English, German and French texts other quotes are activated. The body font is set with:

```
\setupquote[..,.=..,.]
before command
after command
style normal bold slanted boldslanted type cap small... command
color name
location text margin
```

The location of a period, inside or outside a citation is somewhat arbitrary. The opinions on this issue differ considerately.

10.1	Introduction	219
10.2	Definitions	219
10.3	Enumeration	222
10.4	Indenting	226
10.5	Numbered labels	228

10.7	Items	239
10.8	Citations	240

searc	h	go	back	ex	it
M					

He said: "That is a bike" to which she replied: "Take a hike".

The quotes are language dependent. Therefore it is of some importance that language switching is done correctly.

\quotation {He answered: $fr \quad guotation {Je ne parle pas fran c cais}.}$ \quotation {He answered: $quotation {fr Je ne parle pas fran c cais}.}$ $quotation { fr Il r'epondait: quotation{Je ne parle pas fran\c cais}.}$ $fr \quad Il r'epondait: \quad puotation {Je ne parle pas france cais}.}$

Watch the subtle difference.

"He answered: «Je ne parle pas français»."

"He answered: "Je ne parle pas français"."

"Il répondait: «Je ne parle pas français»."

«Il répondait: «Je ne parle pas français».»

When we want different quotes, we can change them. This is a language related setting.

\setuplanguage

[en] [leftquote=\upperleftsinglesixquote,

leftquotation=\upperleftdoublesixquote]

Fo rconsistency, such a setting can best be put into the local system file cont-sys.tex, together with other local settings. The following quotes are available:

\lowerleftsingleninequote \lowerleftdoubleninequote \upperleftsingleninequote \upperleftdoubleninequote \upperleftsinglesixquote \upperleftdoublesixquote

\lowerrightsingleninequote \lowerrightdoubleninequote \upperrightsingleninequote \upperrightdoubleninequote \upperrightsinglesixquote \upperrightdoublesixquote

Lines and frames

11.1 Introduction

 T_EX has an enormous capacity in handling text, but is very weak at handling graphical information. Lines can be handled adequately as long as you use vertical or horizontal lines. However, you can do graphical work with T_EX by combining T_EX and METAPOST.

In this chapter we introduce a number of commands that relate to drawing straight lines in your text. We will see a very sophisticated command \framed that can be used in many ways. The parameters of this command are also available in other commands.

11.2 Single lines

The simplest way to draw a line in CONT_EXT is:

\hairline

For example:

\hairline

In what fairy tale is the wolf cut open and filled with stones? Was it in {Little Red Riding-hood} or in \quote {The wolf and the seven goats}. \hairline

This will become:

In what fairy tale is the wolf cut open and filled with stones? Was it in Little Red Riding-hood or in 'The wolf and the seven goats'.

It does not look good at all. This is caused by the fact that a drawn line gets its own vertical whitespace. In section 11.4 we will show how to alter this.

The effects of the command \hairline is best illustrated when we visualize \strut's. We did so by saying \showstruts first.

11

244

11.1	Introduction	244
11.2	Single lines	244
11.3	Fill in rules	246
11.4	Text lines	248
11.5	Underline	250
11.6	Framing	252
11.7	Framed texts	259

11.9	Black rules	264
11.10	Grids	265

search	go back	exit
N	•	M

-		
-		

A strut is a character with a maximum height and depth, but no width. The text in this example is surrounded by two strutted lines.

It is also possible to draw a line over the width of the actual paragraph:

\thinrule

Or more than one lines by:

\thinrules[..=..]

..=.. see p 246: \setupthinrules

For example:

```
\startitemize
\item question 1 \par \thinrules[n=2]
\item question 2 \par \thinrules[n=2]
\stopitemize
```

If you leave out a \par (or empty line), the thin rules come after the text. Compare

• question 1

• question 2

with

• question 1 _____

• question 2 _____

11.1	Introduction	244
11.2	Single lines	244
11.3	Fill in rules	246
11.4	Text lines	248
11.5	Underline	250
11.6	Framing	252
11.7	Framed texts	259
11.8	Margin rules	263
11.9	Black rules	264
11.10) Grids	265

search	go back	exit
M	• • • • • • • • • • • • • • • • • • •	H

The last example was keyed in as:

\startitemize

\item question 1 \thinrules[n=2]
\item question 2 \thinrules[n=2]
\stopitemize

The parameters are set with:

\setupthinrules	s[=]	
-----------------	------	--

interlinespace n	<u>small</u> medium big <i>number</i>
before	command
inbetween	command
after	command
color	name
backgroundcolor	name
height	dimension max
depth	dimension max
alternative	<u>a</u> b c d
rulethickness	dimension

You can draw thin vertical or horizontal lines with the commands:

\	v1[]
	number
\	hl[]
	number

The argument is optional. To v1() you may pass a factor that relates to the actual height of a line and to h1() a width that relates to the width of an em. So v1[2] produces a rule with a height of two lines.

11.3 Fill in rules

On behalf of questionnaires there is the command:

11.1	Introduction	244
11.2	Single lines	244
11.3	Fill in rules	246
11.4	Text lines	248
11.5	Underline	250
11.6	Framing	252
11.7	Framed texts	259
11.8	Margin rules	263
11.9	Black rules	264
11.10) Grids	265

search go back exit		exit
K	•	M

\fillinline[...,..=...,..]...\par

..=.. see p 247: \setupfillinlines

With the accompanying setup command:

\setupfillinlines[..,..=..,..]

width dimension margin dimension distance dimension before command after command

The example:

\fillinline[n=2,width=2cm]{name} \par
\fillinline[n=2,width=2cm]{address} \par

Leads to the next list:

name

address

An alternative is wanting the fill-in rule at the end of a paragraph. Then you use the commands:

\fillinrules[..,..=..,.]{.1.}{.2.}

..=.. see p 247: \setupfillinrules

\setupfillinrules[..,..=..,..]

width	fit broad dimension
distance	dimension
before	command
after	command
style	normal bold slanted boldslanted type cap small command
n	number
interlinespace	<u>small</u> medium big
separator	text

The next example will show the implications:

11.1	Introduction	244
11.2	Single lines	244
11.3	Fill in rules	246
11.4	Text lines	248
11.5	Underline	250
11.6	Framing	252
11.7	Framed texts	259
11.8	Margin rules	263
11.9	Black rules	264
11.10	Grids	265

search	go back	exit

\fillinline[width=3cm] Consumers in this shopping mall are frequently confronted with questionnaires. Our hypothesis is that consumers rather shop somewhere else than answer these kind of questionnaires. Do you agree with this?	1
In this example we could of course have offered some alternatives for answering this question. By setting the width to broad, we get	
Consumers in this shopping mall are frequently confronted with question- naires. Our hypothesis is that consumers rather shop somewhere else than answer these kind of questionnaires. Do you agree with this?	
The next set of examples demonstrate how we can influence the layout.	
<pre>\fillinrules[n=2,width=fit]{first} \fillinrules[n=2,width=broad]{first} \fillinrules[n=2,width=3cm]{first} \fillinrules[n=2,width=fit,distance=.5em,separator=:]{first} \fillinrules[n=2,width=broad,distance=.5em]{first}{last} first</pre>	 11.1 Introduction 11.2 Single lines 11.3 Fill in rules 11.4 Text lines 11.5 Underline 11.6 Framing 11.7 Framed texts 11.8 Margin rules 11.9 Black rules 11.10 Grids
first	-
first:	
first	
last	

11.4 Text lines

A text line is drawn just before and/or after a paragraph. The upper line may also contain text. The command is:

search	go back	exit
K		M

\textrule[.1.]{.2.}

.1. top bottom

.2. text

An example:

\textrule[top]{Instruments}

Some artists mention the instruments that they use during the production of their λ_{p} . In Peter Gabriel's η_{p} of the dust he used the {\em diembe}, {\em tama} and {\em surdu}. The information on another song mentions the {\em doudouk}. Other \quote {unknown} instruments are used on his $\lambda \left\{ cd \right\}$ used $\{Passion\}$. \textrule

This will result in:

— Instruments -

Some artists mention the instruments that they use during the production of their CD. In Peter Gabriel's 'Digging in the dust' he used the *diembe*, *tama* and *surdu*. The information on another song mentions the *doudouk*. Other 'unknown' instruments are used on his CD 'Passion'.

The behaviour of textlines is set up with the command below. With the parameter width you set the length of the line in front of the text.

\setuptex	trules[,=,]
location before after	<u>left</u> inmargin <i>command</i> <i>command</i>
inbetween	command
width	dimension
distance	dimension
bodyfont	5pt 12pt small big
color	name
style	normal bold slanted boldslanted type cap small command
rulecolor	name

These is also a \start-\stop alternative. This one also honors the bodyfont parameter.

11.1	Introduction	244
11.2	Single lines	244

\starttextrule[.1.]{.2.} ... \stoptextrule

```
.1. top bottom
```

.2. text

11.5 Underline

Underlining text is not such an ideal method to banner your text. Nevertheless we introduced this feature in $ConT_{F}XT$. Here is how it <u>works</u>. We use:

```
\underbar{...}
```

... text

<u>A disadvantage of this command is that words can no longer be hyphenated. This is a nasty</u> side-effect. But we do support nested underlining.

<u>The spaces in the last paragraph were also underlined. If we do not want that in this paragraph we use:</u>

```
\underbars{.. ... ..}
```

From the input we can see that the hyphen results from the compound word.

\underbar {A disadvantage of this command is that words can \underbar {no} longer be hyphenated. This is a nasty side||effect. But we do support \underbar {nested} underlining.}

 \underbars {The spaces in the last paragraph were also underlined. If we do not want that in this paragraph we use:}

The counterpart of these commands are:

```
\overbar{...}
... text
```

11.1	Introduction	244
11.2	Single lines	244
11.3	Fill in rules	246
11.4	Text lines	248
11.5	Underline	250
11.6	Framing	252
11.7	Framed texts	259
11.8	Margin rules	263
11.9	Black rules	264
11.10) Grids	265

search	go back	exit
	•	M

\overbars{..}

You may wonder for what reasons we introduced these commands. The reasons are mainly financial:

 product 1
 1.420

 product 2
 3.182

 total
 4.602

This financial overview is made with:

```
\starttabulate[||r|]
\NC product 1 \NC 1.420 \NC \NR
\NC product 2 \NC 3.182 \NC \NR
\NC total \NC \overbar{4.602} \NC \NR
\stoptabulate
```

The number of parameters in these commands is limited:

The alternatives are: <u>alternative a</u>, <u>alternative b</u>, <u>alternative c</u> while another line thickness results in: <u>1pt line</u>, <u>2pt line</u>.

A part of the text can be striked with the command:

```
\overstrike{...}
... text
```

This command supports no nesting. Single words are striked with:

11.1	Introduction	244
11.2	Single lines	244
11.3	Fill in rules	246
11.4	Text lines	248
11.5	Underline	250

11.9	Black rules	264
11.10	Grids	265

searc	search go ba		exit
M			M

```
\overstrikes{.. ...}
... text
```

11.6 Framing

Texts can be framed with the command: \framed. In its most simple form the command looks like this:

 $framed{A button in an interactive document is a framed text with specific characteristics.}$

The becomes:

A button in an interactive document is a framed text with specific characteristics.

The complete definition of this command is:

```
\framed[...,.=..,.]{...}
...=.. see p 257: \setupframed
... text
```

You may notice that all arguments are optional.

framed

[height=broad]

{A framed text always needs special attention as far as the spacing is concerned.}

Here is the output of the previous source code:

A framed text always needs special attention as far as the spacing is concerned.

For the height, the values fit and broad have the same results. So:

\hbox

 ${\framed[height=broad]{Is this the spacing we want?}}$

\hskip1em

\framed[height=fit] {Or isn't it?}}

11.1	Introduction	244
11.2	Single lines	244

11.10	Grids	265

search go b		go back		exit
м		•	+ -	M

will give us:

Is this the spacing we want? Or isn't it?

To obtain a comparable layout between framed and non-framed framing can be set on and off.

yes	no	yes
no	yes	no

The rulethickness is set with the command \setuprulethickness (see section ??).

A framed text is typeset 'on top of' the baseline. When you want real alignment you can use the command \inframed.

to \framed{frame} or to be \inframed{framed}

or:

to frame or to be framed

It is possible to draw parts of the frame. In that case you have to specify the separate sides of the frame with leftframe=on and the alike.

We will now show some alternatives of the command \framed. Please notice the influence of offset. When no value is given, the offset is determined by the height and depth of the \strut, that virtual character with a maximum height and depth with no width. When exact positioning is needed within a frame you set offset at none (see also tables 11.1, 11.2 and 11.3). Setting the offset to none or overlay, will also disable the strut.

		. 1		^

11

In the background of a framed text you can place a screen or a coloured background by setting background at color or screen. Don't forget to activate the the colour mechanism by saying (\setupcolors[state=start]).

There is also an option to enlarge a frame or the background by setting the frameoffset and/ or backgroundoffset. These do not influence the dimensions. Next to screens and colours you can also use your own kind of backgrounds. This mechanism is described in section 6.7.

The command \framed itself can be an argument of \framed. We will obtain a framed frame.

framed

```
[width=3cm,height=3cm]
```

{\framed[width=2.5cm,height=2.5cm]{hello world}}

In that case the second frame is somewhat larger than expected. This is caused by the fact that the first framed has a strut. This strut is placed automatically to enable typesetting one framed text next to another. We suppress \strut with:

framed

[width=3cm,height=3cm,strut=no]
{\framed[width=2.5cm,height=2.5cm]{hello world}}

When both examples are placed close to one another we see the difference:

11.1	Introduction	244
11.2	Single lines	244
11.3	Fill in rules	246
11.4	Text lines	248
11.5	Underline	250
11.6	Framing	252
11.7	Framed texts	259
11.8	Margin rules	263
11.9	Black rules	264
11.10	Grids	265

A \hairline is normally draw over the complete width of a text (\hsize). Within a frame the line is drawn from the left to the right of framed box.

Consequently the code:

- \framed[width=8cm,align=middle]
 - {when you read between the lines \hairline
 you may see what effort it takes \hairline
 to write a macropackage}

produces the following output:

when you read between the lines	
you may see what effort it takes	
to write a macropackage	

When no width is specified only the vertical lines are displayed.

their opinions differ considerately

Which was obtained with:

framed

{their opinions \hairline differ \hairline considerately} The default setup of \framed can be changed with the command:

11.1	Introduction	244
11.2	Single lines	244
11.3	Fill in rules	246
11.4	Text lines	248
11.5	Underline	250
11.6	Framing	252
11.7	Framed texts	259
11.8	Margin rules	263

The command \framed is used within many other commands. The combined use of offset and strut may be very confusing. It realy pays off to spend some time playing with these macros and parameters, since you will meet \framed in many other commands. Also, the parameters width and height are very important for the framing texts. For that reason we summarize the consequences of their settings in table 11.1, 11.2 and 11.3.

search	go back	exit

	broad	xxxx	XXXX	

Table 11.3 The influence of height and width in \framed.

happy birthday to you At first sight it is not so obvious that \framed can determine the width of a paragraph by itself. When we set the parameter align the paragraph is first typeset and then framed. This feature valuable when typesetting titlepages. In the example left of this text, linebreaks are forced by \\, but this is not mandatory. This example was coded as follows:

11.1	Introduction	244
11.2	Single lines	244
11.3	Fill in rules	246
11.4	Text lines	248
11.5	Underline	250
11.6	Framing	252

11.10) Grids	265

search	go back	exit
μ	•	M

\placefigure

[left]

{none}

{\framed[align=middle]{happy\\birthday\\to you}}

The parameter offset needs some special attention. By default it is set at .25ex, based on the cureently selected font. The next examples will illustrate this:

\hbox{\bf \framed{test} \sl \framed{test} \tfa \framed{test}}
\hbox{\framed{\bf test} \framed{\sl test} \framed{\tfa test}}

The value of 1ex outside \framed determines the offset. This suits our purpose well.

The differences are very subtle. The distance between the framed boxes depends on the actual font size, the dimensions of the frame, the offset, and the strut.

 $T_{E}X$ can only draw straight lines. Curves are drawn with small line pieces and effects the size of DVI-files considerately and will cause long processing times. Curves in $CONT_{E}XT$ are implemented by means of POSTSCRIPT. There are two parameters that affect curves: corner and radius. When corner is set at round, round curves are drawn.

Don't be to edgy.

It is also possible to draw circles by setting radius at half the width or height. But do not use this command for drawing, it is meant for framing text. Use METAPOST instead.

Technically speaking the background, the frame and the text are separate components of a framed text. First the background is set, then the text and at the last instance the frame. The curved corner of a frame belongs to the frame and is not influenced by the text. As long as the radius is smaller than the offset no problems will occur.

11.7 Framed texts

When you feel the urge to put a frame around or a backgroud behind a paragraph there is the command:

[setup startframedtext is undefined]

An application may look like this:

11.1	Introduction	244
11.2	Single lines	244
11.3	Fill in rules	246
11.4	Text lines	248
11.5	Underline	250
11.6	Framing	252
11.7	Framed texts	259
11.8	Margin rules	263
11.9	Black rules	264
11.10	Grids	265

search	go back	exit

In this case the location of the framed text (between []) is left out.

For millions of years mankind lived just like animals. Then something happened, which unleashed the power of our imagination. We learned to talk.

— The Division Bell / Pink Floyd

Intermezzo 11.1 An example of an intermezzo.

You can also draw a partial frame. The following setup produces intermezzo 11.2.

\setupframedtexts[frame=off,topframe=on,leftframe=on]

Why are the world leaders not moved by songs like *Wozu sind Kriege da?* by Udo Lindenberg. I was, and now I wonder why wars go on and on.

Intermezzo 11.2 An example of an intermezzo.

You can also use a background. When the background is active it looks better to omit the frame.

An intermezzo like this will draw more attention, but the readability is far from optimal. However, you read can it. This inermezzo was set up with :

\setupframedtexts[frame=off,background=screen]

Intermezzo 11.3 An example of an intermezzo with background.

Intermezzo 11.4 demonstrate how to use some color:

 $\setup framedtexts$

[background=screen,

frame=off,

rightframe=on,

11.1	Introduction	244
11.2	Single lines	244

framecolor=darkgreen, rulethickness=3pt] \placeintermezzo [here][int:color] {An example of an intermezzo with a trick.} \startframedtext The trick is really very simple. But the fun is gone when Tom, Dick and Harry would use it too. \stopframedtext

The trick is really very simple. But the fun is gone when Tom, Dick and Harry would use it too.

Intermezzo 11.4 An example of an intermezzo with a trick.

So, in order to get a partial frame, we have to set the whole frame to off. This is an example of a situation where we can get a bit more readable source when we say:

```
\startbuffer
\startframedtext ... \stopframedtext
\stopbuffer
\placeintermezzo
```

```
[here][int:color]
{An example of an intermezzo with a trick.}{\getbuffer}
```

You do not want to set up a framed text every time you need it, so there is the following command:

```
\defineframedtext[...][..,.=..,.]
... name
...=.. see p 260: \setupframedtexts
```

The definition:

```
\defineframedtext
[musicfragment]
[frame=off, rightframe=on, leftframe=on]
```

 \stopmusicfragment

results in:

Imagine that there are fragments of music in your interactive document. You will not be able to read undisturbed.

Intermezzo 11.5 An example of a predefined framed text.

11.8 Margin rules

To add some sort of flags to paragraphs you can draw vertical lines in the margin. This can be used to indicate that the paragraph was altered since the last version. The commands are:

```
\startmarginrule[...] ... \stopmarginrule
```

... number

```
marginrule[.1.]{.2.}
```

.1. number

The first command is used around paragraphs, the second within a paragraph.

By specifying a level you can suppress a margin rule. This is done by setting the 'global' level higher than the 'local' level.

```
\setupmarginrules[..=..]
```

level *number* thickness *dimension*

11

In the example below we show an application of the use of margin rules.

\startmarginrule

The sound of a duck is a good demonstration of how different people listen to a sound. Everywhere in Europe the sound is equal. But in every country it is described differently: kwaak||kwaak (Netherlands), couin||couin (French), gick||gack (German), rap||rap (Danish) and mech||mech (Spanish). If you speak these words aloud you will notice that \marginrule[4]{in spite of the} consonants the sound is really very well described. And what about a cow, does it say boe, mboe or mmmmmm? \stopmarginrule

Or:22

The sound of a duck is a good demonstration of how different people listen to a sound. Everywhere in Europe the sound is equal. But in every country it is described differently: kwaak-kwaak (Netherlands), couin-couin (French), gick-gack (German), rap-rap (Danish) and mech-mech (Spanish). If you speak these words aloud you will notice that in spite of the consonants the sound is really very well described. And what about a cow, does it say boe, mboe or mmmmm?

If we would have set \setupmarginrules[level=2] we would have obtained a margin rule in the middle of the paragraph. In this example we also see that the thickness of the line is adapted to the level. You can undo this feature with \setupmarginrules[thickness=1].

11.9 Black rules

Little black boxes —we call them black rules— (**m**) can be drawn by \blackrule:

\blackrule[..,..=..,..]

```
..=.. see p 265: \setupblackrules
```

When the setup is left out, the default setup is used.

²² G.C. Molewijk, Spellingsverandering van zin naar onzin (1992).

exit
-

\setupblackrules[..,..=..,..]

widthdimension maxheightdimension maxdepthdimension maxalternativeadistancedimensionnnumber

The height, depth and width of a black rule are in accordance with the usual height, depth and width of T_EX . When we use the key max instead of a real value the dimensions of T_EX 's \strutbox are used. When we set all three dimensions to max we get:

Black rules may have different purposes. You can use them as identifiers of sections or subsections. This paragraph is tagged by a black rule with default dimensions: \inleft{\blackrule}.

A series of black rules can be typeset by **\blackrules**:

\blackrules[..,.=..,.]

..=.. see p 265: \setupblackrules

There are two versions. Version a sets n black rules next to each other with an equal specified width. Version b divides the specified width over the number of rules. This paragraph is tagged with \inleft{\blackrules}. The setup after \blackrule and \blackrules are optional.

11.10 Grids

We can make squared paper (a sort of grid) with the command:

Blocks

12.1 Introduction

A block in $ConT_EXT$ is defined as typographical unit that needs specific handling. We distinguish the following block types:

• floats

Examples of floats are figures, tables, graphics, intermezzos etc. The locations of these blocks are determined by $T_{E}X$ and depends on the available space on a page.

textblocks

Examples of textblocks are questions and answers in a studybook, summaries, definitions or derivatives of formulas. The location of these kind of blocks in the final document cannot be determined beforehand. And the information may be used repeatedly in several settings.

• opposite blocks

Opposite (or spread) blocks are typeset on the left-hand page when a single sided output is generated. The layout of the right-hand side page is influenced by the blocks on the left.

• margin blocks

Margin blocks are more extensive than single margin words. Text and figures can be placed in the margin with this feature.

There are a number of commands that support the use of these block types. These are discussed in this chapter. Furthermore we will discuss other forms of text manipulation. Formulas can also be seen as blocks. Since formulas are covered in a separate chapter we don't go into details here.

This chapter is typeset with the option \version [temporary]. This does not refer to the content but to the typesetting. With this option, design information is placed in the margin.

12.2 Floats

Floats are composed of very specific commands. For example a table in $ConT_EXT$ is typeset using a shell around T_AB_LE . Drawings and graphics are made with external packages, as T_EX is

Registers

> t \tttf place\s..

only capable of reserving space for graphics.

Most floats are numbered and may have a caption. A float is defined with the command:

```
\definefloat[.1.][.2.]
.1.
.2.
      plural name
```

In CONTEXT, figures, graphics, tables, and intermezzos are predefined with:

\definefloat	[figure]	[figures]
\definefloat	[table]	[tables]
\definefloat	[graphic]	[graphics]
\definefloat	[intermezzo]	[intermezzos]

As a result of these definitions you can always use \placefigure, \placetable, \placegraphic and \placeintermezzo. Of course, you can define your own floats with \definefloat. You place your newly defined floats with the command:

```
\placefloat[.1.][ref,..]{.2.}{.3.}
```

- .1. left right here top bottom inleft inright inmargin margin page opposite always force tall
- .2. text
- .3. text

When a float cannot be placed at a specific location on a page, CONT_EXT will search for the most optimal alternative. CONT_EXT provides a number of placement options for floats. These are listed in table 12.1.

The commands can be used without the left and right brackets. For example:

```
\place...{caption}{content}
```

When the caption is left out, the float number is generated anyway. When the number is not needed you type none, like in:

```
\placefigure{none}{....}
```

It is mandatory to end this command by an empty line or a \par. You don't have to embed a table in braces, since the \start and \stop commands have them built in:

```
\placetable
```

```
[here][tab:example]
```

```

References < fig:reservation > fig:reservation > stp:385 > stp:startfloat*.. Registers

> t \tttf start\s..

This command can be used without the left and right bracket. An example of a reservation is:

\reservefigure

[height=4cm,width=10cm,frame=on][here][fig:reservation] {An example of a reservation.}

Which results in figure 12.1.

figure	

85

Figure 12.1 An example of a reservation.

When the content of a float is not yet available, you can type \empty... instead of \place.... In this way you can also reserve vertical whitespace. When no option is added, so is typed, the default empty float is used. However, whether the figure or table is available is not that important. You can always type:

```
\placefigure{This is a figure caption.}{}
```

As a first argument you can specify a key left or right that will cause CONT_FXT to let the text flow around the float. The second optional parameter can be a cross reference, to be used later, like \at {page} [fig:schematic process].

```
\placefigure[here][fig:demo]{This a figure caption.}{}
```

```
As we will later see, you can also use the next command:
```

- .3. text .4. text

numbering->

Preferences are left, right or middle. Furthermore you can specify offset in case the text should align with the float. Both setups can be combined: [left,offset].

A list of used floats is generated with the command:

\placelistof*floats*

For example, the command \placelistoffigures would typeset a list of figures. The list follows the numbering convention that is set with the command \setupnumbering, which was discussed at page ??.

The next command generates a list of floats on a separate page.

\completelistof*floats*

Pagebreaks that occur at unwanted locations can be enforced in the same way that is done with a table of contents (see section 9.1):

```
\completelistoffloats[pageboundaries={8.2,20.4}]
```

As with tables of content the default local lists are generated. Recalling a list within a chapter produces a list for that specific chapter. So, if you want a list of all figures, you need to specify criterium as all.

12.1	An example of a reservation.	271

content commands index macros

The characteristics of a specific cla	ss of floats are specified with the command:
---------------------------------------	--

$\setupfloat[][,.=,.]$		
	name	
height	dimension	
width	dimension	
pageboundaries	list	
=	see p 257: \setupframed	

The (predefined) floats can also be set up with the more meaningful commands \setupfigures, \setuptables etc.

The height and width relate to the vertical whitespace that should be reserved for an empty float. All settings of \framed can be used, so when frame is set to on, we get a framed float.

The next two commands relate to *all* floats. The first command is used for setting the layout including the caption:

	\setupfloats[.	<pre>\setupfloats[,=,]</pre>	
	location	left right <u>middle</u>	
I	width	fit dimension	
I	before	command	
I	after	command	
	margin	dimension	
I	spacebefore	<i>n*</i> small <i>n*</i> medium <i>n*</i> big none	
	spaceafter	<i>n*</i> small <i>n*</i> medium <i>n*</i> big none	
	sidespacebefore	<i>n*</i> small <i>n*</i> medium <i>n*</i> big none	
I	sidespaceafter	<i>n*</i> small <i>n*</i> medium <i>n*</i> big none	
	indentnext	<u>yes</u> no	
I	ntop	number	
	nbottom	number	
	nlines	number	
	=	see p 257: \setupframed	
I			

The second command is used for setting the enumerated captions of figures, tables, intermezzos, etc.

	\setupcapt location width headstyle style number inbetween align conversion way

You can also set up captions for a specific class of floats, like figures. The first argument of the next command is the name of that class of floats.

```
\setupcaption[...][...,.=..,.]
```

```
... name
...=.. see p 274: \setupcaptions
```

The commands assigned to before, after are are executed before and after placing the float. The parameter inbetween is executed between the float and the caption. All three normally have a \blanko command assigned.

The parameter style is used for numbering (**Figure x.y**) and width for the width of the caption label. The parameter margin specifies the margin space around a float when it is surrounded by text. The float macros optimize the width of the caption (at top or bottom) related to the width of the figure or table.

86

Figure 12.2

With the three variables ntop, nbottom and nlines the float storage mechanism can be influenced. The first two variables specify the maximum number of floats that are saved per page at the top or the bottom of a page.

By default these variables have the values 2 and 0. Assume that ten figures, tables and/or other floats are stored, then by default two floats will be placed at each new page (if possible).

< tex,postscript,.. < tex,postscript,.. content commands index macros

For example, at a forced pagebreak or at the beginning of a new chapter, all stored floats are placed.

The parameter nlines has the default value 4. This means that never less than four lines will be typeset on the page where the floats are placed.

We continue with a few examples of floats (figures) placed next to the running text. This looks like:

```
\placefigure[right]{none}{}
```

... here is where the text starts

For illustrating the mechanism we do need some text. Therefore the examples are used to explain some issues on the float mechanism.

Floats are placed automatically. The order of appearance follows the order you have keyed in the source. This means that larger floats are placed somewhere else in your document. When \version[temporary] is set, you can get information on the float mechanism. By consulting that information you get some insight into the process.

Floats can be surrounded by text. The float at the right was set with \placefigureright[right]{none}{...}. The float mechanism works automatically. Should it occur that pages are left blank as a result of poor float placement, you will need to make some adaptations manually. You can downsize your figure or table or alter your text. It is also a good practice to define your float some paragraphs up in your source. However, all of this should be done at the final production stage.

With the key **force** you can force a float to be placed at that exact location. Tables or figures that are preceded by text like: 'as we can see in the figure below' may be defined with this option.

In manuals and study books we encounter many illustrations. It is almost unavoidable to manually adapt these for optimal display. However, the float commands in $ConT_EXT$ are optimized in such a way that you can produce books with hundreds of floats effortlessly. The worst case is that some floats are stored and placed at the end of the chapter. But this can be influenced with the command

\startpostponing. Postponing is done with the keys always which can be combined with the location, like [left,always] or [here,always]. Because the order of the floats is changed

content commands index macros

several parses are necessary for the document. These processes can be traced via messages on the terminal.

This brings us to a figure that is placed at the left side of a page. The side float mechanism in inspired and based on a mechanism of D. Comenetz. In the background three mechanisms are active. A mechanism to typeset a figure on top, inbetween, of under existing text. There is a mechanism to place figures on the right or left of a page. And there is a third mechanism to typeset text next to a figure.

We see an example of the last mechanism. The text is enclosed by the commands:

\startfiguretext

[right]{none}{\externalfigure[rb00015]}

```
. . . .
```

```
\stopfiguretext
```

It is obvious that we can also place the figure at the left. With \start...text we can add the key offset. Here we used [left,offset].

89

When the text is longer than expected, then it will *not* flow around the float. By default the floats are handled in the same order they are typed in the source file. This means that the stored figures are placed first. If this is not desired you can type the key always. The actual float will get priority.

machine eindr

91

draulische cylinde

There are more options. In this case the setup [right,middle] is given. In the same way we place text high and low.

When the key long is used the rest of the text is filled out with empty lines, as here.

12.3 Combining figures

For reasons of convenience we now discuss a command that enables us to combine floats into one.

```
\startcombination[...] ... \stopcombination
... n*m
```

This command is used to place the figures under or next to each other.

\startcombination....

92

The example in figure 12.3 is typeset with the commands:

```
\placefigure
[here]
[fig:combinations]
{An example of \type{\startcombination...}.}
{\startcombination[3*2]
    {\externalfigure[1b00220]} {a} {\externalfigure[1b00221]} {b}
    {\externalfigure[1b00222]} {c} {\externalfigure[1b00223]} {d}
    {\externalfigure[1b00225]} {e} {\externalfigure[1b00226]} {f}
    \stopcombination}
```

Between [] we specify how the combination is combined: [3*2], [4*2] etc. When we put two floats next to each other it is sufficient to specify [2], [4] etc.

The floats, mostly figures or tables, are specified within two arguments. The first content is

- > stp:437
 > stp:startcombin..
- > fig:combinations
- < fig:combinations

Registers

> t \tttf startco..

M	•	M

12

placed over the second content: {xxx}{yyy}. The second argument can be empty: {xxx}{}. The general construct looks like this:

\startcombination[n*m]

{text	1}	{subcaption	1}
{text	2}	{subcaption	2}

\stopcombination

The combination can be set up with:

```
\setupcombinations[..,.=..,.]
before commando
inbetween commando
```

arter	Commanuo
distance	dimension
height	dimension fit
width	dimension fit
align	no left right middle norma

With distance you specify the horizontal distance between objects. The parameters align relates to the subcaption. By default the text and objects are centered. The width is the total width of the combination.

The three parameters **before**, **after** and **between** are processed in the order of specification in figure 12.5. There are some examples in figure 12.4. We can see in figure 12.6 that when the title in the second argument is empty the spacing adapted.

test	test	test	test	test	test	test	test	test	test	test	test
a	b	С	d	a	b	С	d	a	b	С	d

93

Figure 12.4 The spacing within combinations (1).

Using combinations require figures that have the correct dimensions or equal proportions. Unequally proportioned figures are hard to combine.

The simple version of combining is this:

12.4 **Text blocks**

For practical reasons we sometimes want to key text somewhere in the source that should be typeset at a completely different location in the typeset document. It is also useful to be able to use text more than once. The commands described below are among the eldest of CONT_EXT. They were one of the reasons to start writing the macropackage.

You can mark text (a text block) and hide or move that block, but first you have to define it using:

```
\defineblock[...]
       name
. . .
```

If necessary you can pass several names in a comma-delimited list. After the definition you can mark text with:

\begin*name*

\end*name*

Between the begin- and end command you can use any command you want.

The commands below tell CONT_FXT to hide or recall text blocks:

```
\hideblocks[...,.1.,..][...,.2.,..]
```

- .1. name
- .2. name

```
\useblocks[..,.1.,..][..,.2.,..]
```

- .1. name
- .2. name

\keepblocks[..,.1.,..][..,.2.,..]

- .1. name
- .2. all name

12.8	Postponing text	288
12.9	Buffers	289

search	go	back	exit		
M	•		M		

\selectblocks[...,1.,..][...,2.,..][..=..] .1. name .2. name criterium all section

```
\processblocks[...,1.,..][...,2.,..]
```

.1. name .2. name

These commands make it necessary to process your text at least twice. You can also recall more than one text block, for example [question, answer].

In hidden and re-used blocks commands for numbering can be used. Assume that you use questions and answers in your document. By defining the questions as text blocks you can:

- 1. at that location typeset the questions
- 2. only use the questions and use the answers in a separate chapter
- 3. use questions and answers in a separate chapter
- 4. hide the answers

```
5. etc.
```

When we choose option 2 the definitions look like this:

```
\defineenumeration[question][location=top,text=Question]
```

\defineenumeration[answer][location=top,text=Answer]

```
\defineblock[question,answer]
```

\hideblocks[answer]

A question and answer in the source look like this:

\beginguestion \question Why do we use blocks? \par \endquestion

\beginanswer \answer I really don't know. \par \endanswer

The questions are only used in the text. Questions and answers are both numbered. Answers

M	• •	×

are summoned by:

\chapter{Answers}

\reset[answer] \useblocks[answer]

The command \reset... is necessary for resetting the numbering mechanism. When the answers are used in the same chapter you can use the following commands:

\section{Answers}

```
reset[answer]
\selectblocks[answer][criterium=chapter]
```

You must be aware of the fact that it may be necessary to (temporarily) disable the reference mechanism also:

```
\setupreferencing[state=stop]
```

A more complex situation is this one. Assume that you have several mathematical formulas in your document, and that you want to recapitulate the more complex ones in a separate chapter at the end of the document. You have to specify an [-] at formulas you do not want repeated.

\defineblock[formula]

\beginformula \placeformula[newton 1]\$\$f=ma\$\$ \endformula

This can also be written as:

\beginformula[-] \placeformula[newton 2]\$\$m=f/a\$\$ \endformula

When you re-use the formulas only the first one is typeset. The rest of the formulas is processed, so the numbering will not falter.

The opposite is also possible. By default all local specifications are undone automatically. This means for example that the enumeration of text elements like questions, answers, definitions, etc. can be temporarily stopped. When numbering should continue you specify: [+].²³

Among the parameters of the number mechanism we (in some cases) use the parameter

12.1	Introduction	268
12.2	Floats	268
12.3	Combining figures	277
12.4	Text blocks	280
12.5	Opposite blocks	287
12.6	Margin blocks	287
12.7	Hiding text	288
12.8	Postponing text	288
12.9	Buffers	289

search		go back			exit	
M				•	+	M

²³ When you use enumerations within text blocks you can best use the \start...stop alternative (see page ??).

blockwise. This parameter relates to numbering within a set of blocks, for example per chapter.

You may have a document in which the questions and answers are collected in text blocks. The questions are typeset in the document and the answers in a separate appendix. Answers and question are put at the same location in the source file. When we number the questions and answers per chapter, then question 4.12 is the 12th question in chapter 4. The correct number is used in the appendix. In this example answer 4.12 refers to question 4.12 and not the appendix number.

In case we do want the appendix number to be the prefix of the blocknumber we set the parameter blockwise at no. This is a rather complex situation and will seldom occur.

Earlier we discussed the initializing and resetting of counters. For reasons of uniformity we also have:

```
\reset[..,...]
... name
```

In future there will be an option to sort blocks. For that purpose a second set of optional [] in and \selectblocks is available. The first argument is used for 'tags'. These tags are logical labels that enable us to recall the blocks.

```
\beginremark[important]
This is an important message!
\endremark
```

Now we can recall the 'important' messages by:

```
\useblocks[remark][important]
```

or:

\selectblocks[remark][important][criterium=chapter]

Here, criterium has the same function as in lists (like tables of content) and registers: it limits the search. In this case, only the blocks belonging to this chapter will be typeset.

More than one 'tag' is allowed in a comma delimited list. Text blocks may be nested:

\beginpractice
\beginquestion
\question Is that clear? \par

21	Introduction	268
	muouuction	200

2.9	Buffers	289

search	go back	exit
K		

content commands index macros

\endquestion
\beginanswer
\answer Yes it is! \par
\endanswer
\endpractice

In this case we use three blocks. Such blocks are stored in a file. This file must be available when the blocks are re-used. This means that the document must be processed at least twice. When blocks are summoned at the end of your source file only one processing step is sufficient but then you have to type the command nomoreblocks before the blocks are recalled:

\nomoreblocks

After this command no blocks should be specified. In the future commands will be developed for local adaptations of the layout of text blocks. Until that moment the following command is all there is:

```
\setupblock[..,...][..,.=..,.]
```

```
...namebeforecommandaftercommandinnercommandstylenormal bold slanted boldslanted type cap small... commandfilefile
```

A block is being processed within a group, in other words: within . The setup of before and after are used outside this group, and the setup of inner is used within the group. For example if we mark a re-used text block in the margin we can use the following setup:

```
\defineblock[exampletext]
```

\beginexampletext

If you wonder why this mechanism was implemented consider an educational document with hundreds of $quote {nice to know}$ and $quote {need to know}$ text blocks at several ability levels.

\endexampletext

```
\setupblock[exampletext][inner=\margintitle{reused}]
\useblocks[exampletext]
```

12.1	Introduction	268

12.8	Postponing text	288
12.9	Buffers	289

search	go back	exit
M	•	N

The first text is set without an indicator in the margin and the second is. If we would have used before instead of inner some grouping problems had occurred.

If you wonder why this mechanism was implemented consider an educational document with hundreds of 'nice to know' and 'need to know' text blocks at several ability levels.

reused If you wonder why this mechanism was implemented consider an educational document with hundreds of 'nice to know' and 'need to know' text blocks at several ability levels.

You can import text blocks from other source files. For example if you want to use text blocks from a manual for students in a manual for teachers, you can specify:

 \setupblock

[homework]
[file=student,
 before=\startbackground,
 aften \ starkackground]

after=\stopbackground]

In that case the blocks are imported from the file student.tex. In this example these blocks are typeset differently, with a background. When the student material is specified with:

```
\beginhomework[meeting 1]
```

```
. . . . . . . . . .
```

 $\ensuremath{\mathsf{endhomework}}$

we can summon the blocks in the teacher's manual with:

```
\useblocks[homework][meeting 1]
```

In extensive documents it will take some time to generate these products. But this mechanism garantees we use the same homework descriptions in the students and teachers manual. Furthermore it saves typing and prevents errors.

Questions and answers are good examples of text blocks that can be hidden and moved. The example below will illustrate this. Because commands like \question have a paragraph as an argument the \par's and/or empty lines are essential.

In the setup we see that questions and answers are coupled. A coupling has a meaning in interactive documents.

```
\defineblock[question]
```

```
\defineblock[answer]
```

\defineenumeration[question][location=inmargin,coupling=answer] \defineenumeration[answer][location=top,coupling=question] search go back exit

12.9	Buffers	289

1	

Blocks

287

of questions:

\defineblock[easyquestion,hardquestion]

When both types of questions use the same numbering mechanism, we can recall the hard questions in their original order by hiding the easy questions.

\processblocks[easyquestion]
\useblocks[hardquestion]

12.5 **Opposite blocks**

In future versions of $CONT_EXT$ there will be support of spread based typesetting. For the moment the only command available is:

```
\startopposite ... \stopopposite
```

Everything between start and stop is typeset at the left page in such a way that it is aligned with the last paragraph that is typeset on the right page.

```
\setupoppositeplacing[..=..]
state start stop
```

12.6 Margin blocks

Within limits you can place text and figures in the margin. In this case the margin is handled as a separate (very narrow) page next to the actual page.

\startmarginblock ... \stopmarginblock

This can be setup with:

12.1	Introduction	268
12.2	Floats	268
12.3	Combining figures	277
12.4	Text blocks	280
12.5	Opposite blocks	287

align	left middle right no			
top	command			
inbetween	command			
bottom	command			
left	command			
right	command			
before	command			
after	command			

The mechanism to place blocks is still under construction.

12.7 Hiding text

It is possible to hide text (skip during processing) by:

\starthiding ... \stophiding

12.8 Postponing text

Text elements can be postponed (stored) and placed at the next empty page. This option is needed in case $CONT_EXT$ encounters large figures or tables. The postponed textelement is placed at the next page generated by T_EX or forced by the user with a manual page break.

```
\startpostponing ... \stoppostponing
```

Several text blocks can be postponed and stored. This proces can be followed on screen during document generation.

```
\startpostponing
\placefigure{A rather large figure.}{...}
\stoppostponing
```

When a lot of text elements are postponed or when a figure uses a complete page we advise

12.1	Introduction	268
12.2	Floats	268
12.3	Combining figures	277
12.4	Text blocks	280
12.5	Opposite blocks	287

12.7	Hiding text	288
12.8	Postponing text	288
12.9	Buffers	289

search	go back	exit
M	< >	

you to add \page after the postponing. Otherwise there is the possibility that a blank page is inserted. This is caused by the fact that the postponing mechanism and the float mechanism are completely independent.

```
\startpostponing
\placefigure{A very large figure.}{...}
\page
\stoppostponing
```

12.9 Buffers

Buffers simplify the moving of text blocks. They are stored in a file with the extension tmp and are used to bring readability to your source. Furthermore they can be recalled at any location without retyping them.

```
\startbuffer[...] ... \stopbuffer
```

```
... name
```

\getbuffer[...]

```
... name
```

```
\typebuffer[...]
```

The example below shows the use of these commands.

 \startbuffer

We see that a {\em buffer} works something like a {\em block}.\par \stopbuffer

- \startlines
- ${ \int \langle getbuffer }$
- {\bf \getbuffer}
- {\sl \getbuffer}
- \stoplines

```
This results in:
```

12.1	Introduction	268
12.2	Floats	268
12.3	Combining figures	277
12.4	Text blocks	280
12.5	Opposite blocks	287
12.6	Margin blocks	287
12.7	Hiding text	288
12.8	Postponing text	288
12.9	Buffers	289

We see that a *buffer* works something like a *block*. **We see that a** *buffer* **works something like a** *block***.** *We see that a* **buffer** *works something like a* **block.**

The name is optional. A name makes sense only when several buffers are used. Most of the time the default buffer will do. Most examples in this manual are typed in buffers.

In chapter **??** we can see that the last argument of a \placeblock can be rather extensive. A buffer can be useful when such large tables are defined.

 \startbuffer

```
... many lines ...
\stopbuffer
```

\placetable{A table.}{\getbuffer}

The buffer is set up with:

```
\setupbuffer[...][...,.=..,.]
```

```
... name
paragraph number
before command
after command
```

The first argument is optional and relates to the buffers you defined yourself. You can define your own buffer with:

```
\definebuffer[...]
```

Be aware of possible conflicting names and use capital letters. After this command /getbuffer and /typebuffer are available where *buffer* is the name of the buffer.

Figures

13.1 Introduction

In this chapter we discuss how to place figures in your document. In section 12.2 we introduced the float mechanism. In this chapter the placement of figures is discussed. Most of the time these figures are created with external applications.

After processing a document the result is a DVI file or, when we use $PDFT_EX$, a PDF file. The DVI document reserves space for the figure, but the figure itself will be put in the document during postprocessing of the DVI file. $PDFT_EX$ needs no postprocessing and the external figures are automatically included in the PDF file.

External figures may have different formats like the vector formats EPS and PDF, or the bitmap formats TIF, PNG and JPG. Note that we refer to figures but we could also refer to movies. $CONT_EXT$ has special mechanisms to handle figures generated by METAPOST. We have to take care that fonts used in METAPOST figures are recognized by PDFT_EX. Finally, we'll see that METAPOST code can be embedded in CONT_EXT documents.

Normally, users need not concern themselves with the internal mechanisms used by $ConT_EXT$ for figure processing. However some insight may be useful.

13.2 Defining figures

A figure is designed within specific dimensions. These dimensions may of may not be known by the document designer.

If the original dimensions are unknown, then scaling the figure to 40% can have some astonishing results. A figure with width and height of 1 cm becomes almost invisible, but a figure width width and height of 50 cm will still be very large when scaled to 40% of its original size.

13

13.1	Introduction	292

13.6	Extensions of figures	301
13.7	Movies	302
13.8	Some remarks on	
	figures	303

A better strategy is to perform the scaling based on the current bodyfont size, the width of text on the page, or to set absolute dimensions, such as 3 cm by 2 cm.

To give T_EX the opportunity to scale the figure adequately the file format must be known. Table 13.1 shows the file formats supported by DVIPS, DVIPSONE, and PDF T_EX respectively. PDF T_EX has the unique capability to determine the file format during processing.

When we use DVI, T_EX can determine the dimensions of an EPS illustration by searching for the so called *bounding box*. However, with other formats such as TIF, the user is responsible for the determination of the figure dimensions.

	EPS	PDF	METAPOST	TIF	PNG	JPG	MOV
DVIPS	+	-	+	-	-	-	+
DVIPSONE	+	-	+	+	-	-	+
pdfT _E X	-	+	+	+	+	+	+

Table 13.1Some examples of supported file formats.

Now, let us assume that the dimensions of a figure are found. When we want to place the same figure many times, it would be obvious to search for these dimensions only once. That is exactly what happens. When a figure is found it is stored as an object. Such an object is re-used in T_EX and in PDF but not in DVI, since reuse of information is not supported by the DVI format. To compensate for this shortcoming, when producing DVI output, CONTEXT will internally reuse figures, and put duplicates in the DVI file.

\useexternalfigure[some logo][logo][width=3cm]

\placeexternalfigure{first logo}{\externalfigure[some logo]}

\placeexternalfigure{second logo}{\externalfigure[some logo]}

So, when the second logo is placed, the information collected while placing the first one is used. In $PDFT_{EX}$ even the content is reused, if requested, at a different scale.

A number of characteristics of external figures are specified by:

content	commands

\setupexternalfigures[=]	

option	frame empty test
object	<u>yes</u> no
frames	on <u>off</u>
ymax	number
xmax	number
directory	text
location	local global default none
maxwidth	dimension
maxheight	dimension

This command affect all figures that follow. Three options are available: frame, empty and test. With empty no figures are placed, but the necessary space is reserved. This can save you some time when 'testing' a document.²⁴ Furthermore the figure characteristics are printed in that space. When frame is set at on a frame is generated around the figure. The option test relates to testing hyperactive areas in figures.

When $ConT_EXT$ is not able to determine the dimensions of an external figure directly, it will fall back on a simple database that can be generated by the PERL script T_EXUTIL . You can generate such a database by calling this script as follows:

```
texutil --figures *.tif
```

This will generate the texutil.tuf file, which contains the dimensions of the TIF figures found. You need to repeat this procedure every time you change a graphic. Therefore, it can be more convenient to let $CoNT_EXT$ communicate with T_EXUTIL directly. You can enable that by adding \runutilityfiletrue to your local cont-sys.tex file.

When a figure itself is not available but it is listed in the texutil.tuf file then $ConT_EXT$ presumes that the figure does exist. This means that the graphics do not need to be physically present on the system.

Although $ConT_EXT$ very hard tries to locate a figure, it may fail due to missing or invalid figure, or invalid path specifications (more on that later). The actual search depends on the setup of directories and the formats supported. In most cases, it it best not to specify a suffix or type.

```
\exernalfigure[hownice]
\exernalfigure[hownice.pdf]
\exernalfigure[hownice][type=pdf]
```

13.1	Introduction	292

13.7	Movies	302
13.8	Some remarks on	
	figures	303

 $^{^{24}}$ A similar effect can be obtained with the **--fast** switch in TeXexec.

295

In the first case, CONT_EXT will use the graphic that has the highest quality, while in both other cases, a PDF graphic will be used. In most cases, the next four calls are equivalent, given that hownice is available in METAPOST output format with a suffix eps or mps:

```
\exernalfigure[hownice]
\exernalfigure[hownice][type=eps]
\exernalfigure[hownice][type=eps,method=mps]
\exernalfigure[hownice][type=mps]
```

In most cases, a METAPOST graphic will have a number as suffix, so the next call makes the most sense:

```
\exernalfigure[hownice.1]
```

Let us summarize the process. Depending on the formats supported by the currently selected driver (DVI, PDFT_FX, etc.), CONT_FXT tries to locate the graphics file, starting with the best quality. When found, CONT_FXT first tries to determine the dimensions itself. If this is impossible, CONT_FXT will look into texutil.tuf. The graphic as well as the file texutil.tuf are searched on the current directory (local) and/or dedicated graphics directories (global), as defined by \setupexternalfugures. By default the location is set at {local,global}, so both the local and global directories are searched. You can set up several directories for your search by providing a comma-delimited list:

```
\setupexternalfigures[directory={c:/fig/eps,c:/fig/pdf}]
```

Even if your operating uses a $\$ as separator, you should use a /. The figure directory may be system dependent and is either set in the file cont-sys, in the document preamble, or in a style.

An external figure is summoned by the command \externalfigure. The cow is recalled with:

```
\exernalfigure[koe][width=2cm]
```

For reasons of maintenance it is better to specify all figures at the top of your source file or in a separate file. The figure definition is done with:

13.1	Introduction	292
13.2	Defining figures	292
13.3	Recalling figures	297
13.4	Automatic scaling	298
13.5	T _E X-figures	300
13.6	Extensions of figures	301
13.7	Movies	302
13.8	Some remarks on	
	figures	303

\useexternalfigure[.1.][.2.][=]	I
(

1	nomo
.1.	name
.2.	file
scale	number
factor	max fit broad
wfactor	<i>number</i> max broad fit
hfactor	<i>number</i> max broad fit
width	dimension
height	dimension
frame	on <u>off</u>
preset	<u>yes</u> no
display	file
preview	yes <u>no</u>
repeat	yes <u>no</u>
object	<u>yes</u> no
type	eps mps pdf tif png jpg mov tex
method	eps mps pdftifpng jpg mov tex

Valid definitions are:

```
\useexternalfigure [cow]
\useexternalfigure [some cow] [cow230]
\useexternalfigure [big cow] [cow230] [width=4cm]
```

In the first definition, the figure can be recalled as cow and the graphics file is also cow. In the second and third definition, the symbolic name is some cow, while the filename is cow230. The last example also specifies the dimensions.

The scale is given in percentages. A scale of 800 (80%) reduces the figure, while a value of 1200 (120%) enlarges the figure. Instead of using percentages you can also scale with a factor that is related to the actual bodyfont. A setup of hfactor=20 supplies a figure with 2 times the height of the bodyfont size, and bfactor=120 will result in a width of 12 times the bodyfont size (so 144pt when using a 12pt bodyfont size). When we want to place two figures next to one another we can set the height of both figures with hfactor at the same value:

```
\useexternalfigure[alfa][file0001][hfactor=50]
\useexternalfigure[beta][file0002][hfactor=50]
```

\placefigure

```
{Two figures close to one another.}
```

```
\startcombination[2]
```

```
{\externalfigure[alfa]} {this is alfa}
```

3.1	Introduction	292

3.8	Some remarks on	
	figures	303

search	go back	exit
H	• •	M

{\externalfigure[beta]} {this is beta}
\stopcombination

We can see that \externalfigure is capable of using a predefined figure. The typographical consistency of a figure may be enhanced by consistently scaling the figures. Also, figures can inherit characteristics of previously defined figures:

```
\useexternalfigure [alfa] [file0001] [hfactor=50]
\useexternalfigure [beta] [file0002] [alfa]
\useexternalfigure [gamma] [file0003] [alfa]
\useexternalfigure [delta] [file0004] [alfa]
```

Normalizing a figure's width must also be advised when figures are placed with \startfiguretext below one another.

In most cases you will encounter isolated figures of which you want to specify width or height. In that case there is no relation with the bodyfont except when the units **em** or **ex** are used.

In figure 13.1 we drew a pattern with squares of a factor 10.

1 2 3 4 5 6 7 8 9 10111213141516171819202122232425262728293031

Figure 13.1 Factors at the actual bodyfont.

13.3 Recalling figures

A figure is recalled with the command:

```
\externalfigure[...][..,..=..,.]
... file
..=.. see p 296: \useexternalfigure
```

For reasons of downward compatibility a figure can also be recalled with a command that

sear	ch		go b	ack	exit
		1			1
M		•			M

13.1	Introduction	292
13.2	Defining figures	292
13.3	Recalling figures	297
13.4	Automatic scaling	298
13.5	T _E X-figures	300
13.6	Extensions of figures	301
13.7	Movies	302
13.8	Some remarks on	
	figures	303

equals the figure name. In the example below we also could have used \akoe and \bkoe, unless they are already defined. Using \externalfigure instead is more safe, since it has its own namespace.

```
\useexternalfigure[akoe][koetje][factor=10]
\useexternalfigure[bkoe][koetje][factor=20]
```

\placefigure[left]{none}{\externalfigure[bkoe]}

The \hbox {\externalfigure[akoe]} is a very well known animal in the Dutch landscape. But for environmental reasons the \hbox {\externalfigure[akoe]} is slowly disappearing. In the near future the cow will fulfil a marginal \inleft {\externalfigure[bkoe]} role in the Netherlands. That is the reason why we would like to write the word \hbox {\externalfigure[bkoe]} in big print.

Here we see how akoe and bkoe are reused. This code will result in:

The 🐕 is a very well known animal in the Dutch landscape. But for environmental reasons the 🐄 is slowly disappearing. In the near future the cow will fulfil a marginal

role in the Netherlands. That is the reason why we would like to write the word in big print.

Normalized figures adapt to the actual bodyfont at least when the font is set with \setupbodyfont or \switchtobodyfont. When a text is used for different media and is generated with different fontsizes the use of normalized figures is a good practice. The example above looks different in a smaller fontsize.

The 🕦 is a very well known animal in the Dutch landscape. But for environmental reasons the 🐄 is slowly disappearing. In the near future the cow will fulfil a marginal role in the Netherlands. That is the reason why we would like to write the word in big print.

13.4 Automatic scaling

In cases where you want the figure displayed as big as possible you can set the parameter factor at max, fit or broad. In most situations the value broad will suffice, because then the caption still fits on a page.

3.1	Introduction	292
3.2	Defining figures	292
3.3	Recalling figures	297
3.4	Automatic scaling	298

3.8	Some remarks on	
	figures	303

searc	h	go back	exit
M			M

299

content commands index macros

setup	result
max	maximum width or height
fit	remaining width or height
broad	more remaining width or height
number	scaling factor (times 10)

So, one can use max to scale a figure to the full page, or fit to let it take up all the remaining space. With broad some space is reserved for a caption.

Sometimes it is not clear whether the height or the width of a figure determines the optimal display. In that case you can set factor at max, so that the maximal dimensions are determined automatically.

\externalfigure[cow][factor=max]

This figure of a cow will scale to the width or height of the text, whichever fits best. Even combinations of settings are possible:

```
\externalfigure[cow][factor=max,height=.4\textheight]
```

In this case, the cow will scale to either the width o fthe text or 40% of the height of the text, depending on what fits best.

As already said, the figures and their characteristics are stored in the file texutil.tuf and can be displayed with:

```
\showexternalfigures[..,..=..,.]
alternative <u>a</u>bc
```

There are two alternatives: a, b and c. The first alternative leaves room for figure corrections and annotations, the second alternative is somewhat more efficient and places more figures on one page. The third alternative puts each figure on its own page. Of course one needs to provide the file texutil.tuf by saying:

texutil --figures *.mps *.jpg *.png

Even more straightforward is running T_EXEXEC, for instance:

13.1	Introduction	292
13.2	Defining figures	292
13.3	Recalling figures	297
13.4	Automatic scaling	298

13.8	Some remarks on	
	figures	303

search	go back	exit
м	•	H

texexec --figures=c --pdf *.mps *.jpg *.png

This will give you a PDF file of the figures requested, with one figure per page.

13.5 T_EX-figures

Figures can be scaled. This mechanism can also be used for other text elements. These elements are then stored in separate files or in a buffer. The next example shows how a table is scaled to the pagewidth. The result is typeset in figure 13.2.

\startbu	uffer[table]

fit	automatically	automatically	automatically	width or height
broad	automatically	automatically	automatically	width or height
	width	height	isometric	original dimensions

Figure 13.3 An example of a T_EX figure.

Buffers are written to a file with the extension tmp, so we recall the table with table.tmp. Other types of figures are searched on the directories automatically. With T_EX figures this is not the case. This might lead to conflicting situations when an EPS figure is meant and not found, but a T_EX file of that name is.

13.6 Extensions of figures

In the introduction we mentioned different figure formats like EPS and PNG. In most situations the format does not have to be specified. On the contrary, format specification would mean that we would have to re–specify when we switch from DVI to PDF output. The figure format that $CONT_{E}XT$ will use depends on the special driver. First preference is an outline, second a bitmap.

METAPOST figures, that can have a number as suffix, are recognized automatically. $CONT_EXT$ will take care of the font management when it encounters METAPOST figures. When color is disabled, or RGB is to be converted to CMYK, $CONT_EXT$ will determine what color specifications have to be converted in the METAPOST file. If needed, colors are converted to weighted grey

302

scales, that print acceptable on black and white printers. In the next step the fonts are smuggled into the file.²⁵ In case of PDF output the METAPOST code is converted into PDF by $T_{\rm E}X$.

If necessary the code needed to insert the graphic is stored as a so called object for future reuse. This saves processing time, as well as bytes when producing PDF. You can prevent this by setting object=no.

When EPS and MPS (METAPOST) figures are processed CONT_{E} XT searches for the high resolution bounding box. By default the POSTSCRIPT bounding box may have a deviation of half a point, which is within the accuracy of our eyes. Especially when aligning graphics, such deviations will not go unnoticed.

CONT_EXT determines the file format automatically, as is the case when you use:

```
\externalfigure[koe]
```

Sometimes however, as we already explained, the user may want to force the format for some reason. This can be done by:

```
\externalfigure[koe.eps]
\externalfigure[koe][type=eps]
```

In special cases you can specify in which way figure processing takes place. In the next example $CoNT_EXT$ determines dimensions asif the file were in EPS format, that is, it has a bounding box, but processes the files as if it were a METAPOST file. This kind of detailed specification is seldom needed.

```
\externalfigure[graphic.xyz][type=eps,method=mps]
```

The automatic searching for dimensions can be blocked by preset=no.

13.7 Movies

In CONTEXT moving images or 'movies' are handled just like figures. The file format type is not determined automatically yet. This means the user has to specify the file format.

\externalfigure[demo.mov][label=demo,width=4cm,height=4cm,preview=yes]

With this setup a preview is shown (the first image of the movie). If necessary an ordinary (static) figure can be layed over the first movie image with the overlay mechanism.

м	< >	M

 $^{^{25}}$ Fonts are a problem in METAPOST files, since it it up to the postprocessor to take care of them. In this respect, METAPOST output is not self contained.

303

Movies can be controlled either by clicking on them, or by providing navigational tools, like:

... \goto {start me} [StartMovie{demo}] ...

A more detailed discussion on controlling widgets is beyond this chapter. Keep in mind that you need to distribute the movies along with your document, since they are not included. This makes sense, since movies can be pretty large.

13.8 Some remarks on figures

Figures, and photos in particular, have to be produced with consistent proportions. The proportions specified in figure 13.4 can be used as a guideline. Scaling of photos may cause quality loss.

Figure 13.4 Some preferred image proportions.

In the background of a figure you typeset a background (see figure ??). In this example the external figures get a background (for a black and white reader: a green screen).

 \setupfloats

[background=color, backgroundcolor=green,

backgroundoffset=3pt]

\useexternalfigure [koe]

[bfactor=80,

background=screen,

backgroundscreen=0.75]

Note that we use only one float and that there are six external figures. The background of the float is used for the complete combination and the background of the external figure only for

 $CONT_EXT$ is a macropackage written in the typographic programming language T_EX . It offers the user a wide range of tools to typeset documents. Although $CONT_EXT$ originally was written to facilitate the development of educational documents, it can handle all kind of simple and complex forms of documentation.

Therefore CoNT_EXT is used for a wide range of documents, like books of technical or more scolar nature, computer manuals, the often huge and complex quality assurance manuals and technical manuals to machines, books of encyclopedian nature, database(d) documents, and collections of documents that have common characteristics. Reuse of sources, data-abstraction and structure is typical a job for CONT_EXT.

Due to the nature of T_EX, CONT_EXT is well suited to process documents coded in a mediumneutral way. Paper output as well as highly interactive screen documents are both supported. There is a very complete support for PDF and XML and the related technologies.

CONT_EXT is avaliable 'for free'. Apart from this reference manual, there are manuals for starters in several languages. There are also documents that describe the basic functionality. There are example styles as well as many examples of documents produced by CONT_EXT.
